So....external mount possible? Beam. Internal to the house? Halo. Need a small directional antenna? Rotatable dipole...either with hamsticks or just the cheap RatShak 72" whips. FM is easily handled with a J-Pole (the others have described it quite well...google for plans....lots of them out there). One note....a friend has his quad mounted in the attic....just so happened that the quad fit perfectly. Missed the supports by a couple of inches. As the roof is composition shingles and has no metal (other than nails) it does not affect operation too badly.

Tell the wife that the higher and more directional the antenna, the less chance of having interference in the house!! Heh....65' tower & 7 ele. Long John beam!

HTH!
Andrew

3295. Re: [6 Meter Sked] Long Wire Antenna

1) Local work (non DX) is what you will be doing a lot of...sooo plan for the best LOCAL use antenna...it will perform great also during band openings.
2) Since FM is out, forget verticals.....
3) go with a dipole..or cross dipoles...(why build one when you can have two at twice the price??? "Contact") All it takes is coax and wire to add the other one..you have everything you need to do the turnstile...
4) your dipole was too short.....make both ends longer and get it as high as you can...but remember, a dipole has a figure 8 pattern...NULLS off the end.

MY antenna right now is a halfwave dipole made of cut down CB 108" whips..in the horiz mode....mounted at 30ft off ground with the ends pulled BACK at 45 deg angles (looks like a V lying on its side)... gives a somewhat omni pattern....old style FM BC antenna used this config...not perfect but better than nothing....and cheap! I bought the mount for the whips at EPO here in Houston but you can mail order them..they were $3.00...that gave me a single SO239 jack and two 3/8x24 studs to mount the whips on....and then mount on the TV mast..

Easy and it works.
Next is the turnstile...have the parts for that but havent gotten to taking down the current arrangement and changing it.

It may sound a bit 'mean spirited', but there are some 18 Yahoo groups specifically for or about Amber Alerts. Perhaps if those interested in seeing (and being vigilant) them subscribed to those lists, we can prevent the "NUMBNESS FACTOR" from setting in.

The "NUMBNESS FACTOR" about Amber Alerts is similar to the one that has set in about "HOMELAND SECURITY THREAT LEVEL ALERTS". Hardly anybody does anything different in their daily lives (other than SOME public safety agencies) when the threat level/color changes. A few states and cities have already stated they are no longer going to ratchet up their activities (and expense) every time the HSD bumps the color level.

I have 7 grandkids and do usually pay attention to the VERY FEW Amber Alerts that hit the local media - but I do not want to be bombarded in every venue I tune in to. Being bombarded will make us all NUMB to the problem - we'll just tune-out.

==========
There are a staggering number of missing kids and child abductions each year in the US. Most turn out to be familial problems - with the perpetrator being an estranged parent or other close relative. A few, unfortunately, do turn out to be real tragedies - and it especially hurts when it's a family member or even someone you know.

I'm sure we all are sensitive to the tragedies of child abductions and public spirited enough to care. However, bombarding the public with amber alerts seems to make people numb to them.

Why do you think the network news shows don't put them all on the air every day ?
Why do you think the daily newspaper don't carry then every day ?
Why is there no 'free newspaper' of just Amber Alerts ?

The media only seem to carry the unusual or bizarre ones.

Some police agencies do not even participate in the amber alert system. It is seemingly a worthwhile public service act (after all, it is "for the children"), having resulted in the return of a few children who might have otherwise been lost forever. However, it can be very time consuming and labor intensive for the reporting agency. A few police agencies also use a threshold similar to the ones used to trigger their 'missing persons reports' (the person must be missing for at least 24 or 48 hours), thereby thwarting the prime objective -- early notification. When it comes to child abductions, the first few hours are critical to a successful outcome.

Many missing kids were found to be at the movies, visiting friends, in the library, to have 'forgotten about the time', or just engaged in activities that they did not want their parents to know about. I was a kid once and can understand why a kid today does not want their parents knowing what they're doing 7x24.

In addition, many city & county corporation counsels (the city's lawyer) have been advising their client agencies that amber alert participation, while worthwhile, carries some potential legal liability if mistakenly issued or not withdrawn in a timely manner once

resolved.

I would hazard a guess that only a very small fraction of kids who do go missing become the subject of amber alerts.

I think use of a dedicated Amber Alert Yahoo group (there are already a few) would let everyone decide for themselves how closely they want to monitor them.

The federal government also intended that the emergency notification system used by NOAA be part of the notification mode. The newer weather alert radios that have the SAME capability would be a great venue to get the message out. This would let the alerts be directed at targeted areas. However, we are still faced with the same problem - if every missing child was the subject of an Amber Alert, the public would soon become very numb to the HUNDREDS of alerts that would issued EVERY DAY.

PUTTING IT INTO PERSPECTIVE - COMPETING PRIORITIES.
All such problems in our society have to be put into perspective in order to balance the competing priorities. Almost everyone agrees that is was worthwhile to require seat belts and air bags in cars - they save a few thousand lives a year in the US. Then why don't we outlaw tobacco? After all, it results in 350,000 to 400,000 deaths a year - IN THE US ALONE. Another example of perspective: Enough people (mostly kids) to fill three 747's (about 1,200 total) die of Malaria in Africa EVERY DAY. EVERY DAY. And the reaction of most people? Let's not make the DDT that had almost eradicated Malaria in Africa up to a few years ago.

IT'S ALL ABOUT PERSPECTIVE - UNTIL IT HITS CLOSE TO HOME.

Didn't you know? By saying something should be as widely disemminated as possible, it justifies off topic posting of no interest to the majority of the group!

Thank goodness for the delete key.

Thanks for the reminder, but really now. If I have to rely on this list to warn me of a major storm (for me that would translate into a hurricane) then I DESERVE to have my house blown away. If the storm warning is just a severe thunderstorm or urban flood advisory, I will hear or see it coming, or I will be sleeping. Either way, by the time I read the warning on this list the storm will be over.

As for the amber alerts, this is a more touchy subject. On one hand there is already quite a bit of traffic on this list, with the band opening notifications (and the dozen follow up messages saying "no opening here"), the antenna building discussions, and so forth. On the other hand, amber alerts are serious messages intended to reach as wide an audience as possible as quickly as possible.

My suggestion to everyone is either read or delete amber alert messages, and stop replying to them. This way, there will not be a whole slew of replies about if amber alerts relate to 6 meters or not - and as a consequence less "non-ham radio" traffic on the list.

Anyway just my thoughts on the thread. There is no real need to reply to this, if you agree just delete this message and carry on. If you disagree you have probably deleted this message already :)

I am in no way trying to put anyone down by the way, just making a comment.

Date: 2003-08-03 23:11:19 UTC
From: Jamie R. Dean
Topic: 3312 Message: 3312

After listening to the comments from the users of this group I have decided that since this is a 6 meter group only msgs involving 6 meter operations, radios, antennas, band openings and anything pertaining to 6 meters will be allowed, period.

Also I am working hard on stopping the porn spammers. The few msgs that make it to the group or only a small fraction of the ones that are sent to the group. Each day the group has 5 + porn spammers trying to join the group and yes once in a while I let one slip through the cracks. But be assured that I am doing my best to filter these people out.

If anyone has any questions please feel free to e-mail me.

73 and Good DXing,

Jamie R. Dean

Good enough for me!!! Now was anything happening last night?? There was
a lot of inversion along the TX Gulf Coast....heard FMs all over the
place and TV6 from three places was booming into Houston...but NOONE on
52.525 or 50.125 :(

> Also I am working hard on stopping the porn spammers. The few msgs that make

They have been getting sneaky...I kill several new subscribers to my
lists every week.....but that doesnt stop them..NOW the spammers are
sending the stuff to me as list owner OR faking my own address as the
return...making Mailwasher useless in bouncing those! :(BUT at least
the lists are clean....I am seriously looking at moving some of my lists
to QTH.net...no ads and no spam.....(have some lists there already) and
its run by a ham...though some people have problems with Al Walker, etc..
oh well...."you cant please everyone.....you gotta please yourself"
(Ricky Nelson..."Garden Party")

Bring on the openings!!!! More SIX in our lives :)

We had a good opening into OKLA last night. Didn't hear much on .525 FM but .125 was full of stations for a good part of the evening. Worked NW to Montana and Idaho initially, then the SE came in from NC for a while before it moved up to Indiana and Ohio. Finally worked several Canadian stations before the band died shortly before 10pm CDT. During that time the band was busy from .125 to .225. Sorry it didn't make it into Houston TX.

3319. Confused about 6m repeater frequencies

Yahoo group: 6meter (2000 — 2003)
Date: 2003-08-04 14:49:33 UTC
From: vhfradiobuff@aol.com
Topic: 3319 Message: 3319

I was going to enter most of the 6 meter repeater frequencies in my FT-100D but I am confused because I have read many different things about what the right bandplan is for 6 meter repeaters. The 2002/2003 ARRL directory lists the following: 51.12-51.48 input 51.62-51.98 output 52.00-52.48 input 52.50-52.98 output 53.00-52.49 input 53.50-53.98 output This conflicts with what's been posted here and with what I've read elsewhere on the net. Does anyone know where I can find a list of every 6 meter repeater frequency with it's corresponding input frequency? Since there are 3 different offsets for 6m, it's a bit confusing (1 mhz, 1.7 mhz and .600 mhz). =-=-=-=-=-=-=-=-=-=-=-=-=-=-=- 73! de Andy KC2SSB (ex: KF4KHC/HL9HCT) Beachwood, NJ USA! Thanks, you do a good job. Better than I could do. I have an Idea on the Spam. It IS 6 meters cause it is a ^ meter list that gets it. Get a "GOOD" email address of hot shot people in Washington. Like Sen. Ted Kennedy. Forward it to him. tell him that if it is ok for the spamers to send it to you, it is ok for you to send it to him. If he gets 5000 offers a day to make his little thingy BIGGER, maybe he will do something on the hill to stop it. It is only fair that if we must put up with it, he should also. We are NOT in a place to stop it, HE IS!!!!.
IMHO!. but, what do I know?

Yeah it was DEAD here to the north...PROBABLY was good east and west (like the FM and TV bands...I was seeing lines under KPRC TV2 here...) but noone was there :(Even the beacon subband was quiet...all I heard were the birdies off my PCs in the other room...(I have got to get the older one cleaned up..the new 2.4GHZ Dell is quiet on HF and 6...but the older 350MMXII has birdies in several places!)

The ARRL Band Plan is NOT the national plan; it is merely a suggested plan and only two or three areas use it...the rest of the country is on the -1 MHz or -1.7 MHz offsets nor was it implemented via a vote of 6mtr users or even an open discussion!! Your LOCAL or REGIONAL plan ALWAYS is before the ARRL plan..though they dont mention that in BOLD LETTERS! (why?)

Read my articles on the bandplan changes and history on the 6mt.com site (main URL is http://6mt.com) It will explain it all AND where the band SHOULD be headed...
The article is at: http://6mt.com/fm2bp.doc
(though the HTML chart in the middle did not get posted correctly...and thus its kinda hard to read since it shows it in a TEXT mode only :(If you want the correct version, let me know and I will send you a copy...)
Also another suggested article on effective rcvr sensitivity (which affects us who operate 6 more than ANY other band) is:
http://6mt.com/fm1.doc

^^^^^^^^^^
That should be 500kHz not 600
but thats ok... Chris

Forget trying to enter repeater pairs by the bandplan. Local coordination groups should be able to give you a list of repeater pairs/PLs for each area. For example, our local group (SERA....great bunch of guys & gals!!) publish a listing for the SE US with all known active repeaters. I imagine that something similar exists in the NE corridor. Try http://www.artscipub.com/repeaters/ for some listings which cover NJ.

Thanks for the replies. I will look at the articles mentioned. I don't only want to have freqs of local repeaters, because during a band opening, I'd love to be able to just go through the memory channels and come across repeaters a hop or two away. It's too bad there's no standard band plan though. I am sure when I read the articles, it'll be clearer to me.

3326. 6-Meter Dipole or other wire antenna that is simple to build info???

6-Meter Dipole or other wire antenna that is simple to build info???

Hello,

I am a new ham who is looking to build my first antenna. I am looking for some info on building a 6-meter antenna. (wire j-pole, dipole ect...)

If I am building a antenna for 6 meters, do I make my element length calculations based on 54MHz?

If any of you have any plans/advise, please let me know...

Thanks for your help!

Must be something about TX, I am on the GA/SC border
(Augusta,GA) and I have noticed the same thing. Around
sunset and for a litttle while after TX and OK and
some of the other surrounding states are all I can
hear.I find this curious,especially since it has
rained here everyday for the past month.Haven't been
hearing much of anything(except TX!) Oh well, time to
get back to building the Ark while the rain has
stopped!

3338. Broadband over Powerlines

Yahoo group: 6meter (2000 — 2003)
Date: 2003-08-09 18:04:04 UTC
From: n4km@aol.com
Topic: 3338 Message: 3338

Hey Guys, If any of you have not commented yet on the proposed rule to allow broad band transmittion over powerlines, you need to do wo soon. Go to the ARRL at www.arrl.org and read some of the articles they have there. This would mean the end of amateur radio on the frequencies from 2MHZ to 80MHZ. After you read the stuff from the ARRL, do the following. Once you know what you want to say, go to http://gullfoss2.fcc.gov/prod/ecfs/upload_v2.cgi Fill in the following fields on the submission form: 1 Type in 03-104 2 Click on "Name" (default) 3 Type in your name 6 Type in your e-mail address 7 Type in your mailing address 8 Type in your city 9 Select state from the drop down list 10 Type in your zip code 12 Should read "Comment". If not, select it from the drop down list. Once the "Cover Sheet" is completed, scroll down to the bottom of the page to the "Send a Brief Comment to FCC (typed-in)" box. Simply type in your comments into the box (be sure to hit carriage return after 70 characters). Or you can type out your comments in a word processing program and simply "cut and paste" them into the comment box. Check for spelling and grammatical errors! Once you are done, click on the "Send Brief Comment to FCC" button. There will be one more "confirmation" page (sorry, I don't remember what it says or what to "click"). Once that page is OK'd, your comments will be submitted and added as part of the record. Describing the process is actually more difficult than the process itself! So far there have only been about 2500 comments on this bill. That is just a drop in the bucket for what we need. Some of the 2500 comments are even for the bill, so we have a long way to go. If you need any help filing you comments please let me know. 73, Kevin N4KM [Non-text portions of this message have been removed]

3339. Diamond V 2000A

Yahoo group: 6meter (2000 — 2003)
Date: 2003-08-10 17:17:49 UTC
From: worksntv@aol.com
Topic: 3339 Message: 3339

I am wondering if anyone on the list can assist me.

I recently bought a Diamond V 2000A, which tuning is preset for 2 and 440 but allows an adjustment for 6 meters.

The 6 meter tuning instructions shows a chart for shortening/lengthing one of the radials for 6 meters. The chart shows the lowest freq of 52 MHz. I assume by cutting the "rod" shorter will allow the antenna to tune around 50. 5 MHz.

Has anyone run into this situation? Is there a possibility that setting the antenna at 52 MHz would allow it to play at the lower part of the band without MEGA high SWR? OR is it a situation the SWR would not be acceptable??

Thanks in advance and 73'

Bob

From: Keith Beckmann
Topic: 3340 Message: 3340

You need to lengthen this rod for it to be resonant at a lower frequency.

Think of it like a 6M antenna is quite long, and a 70CM antenna is quite short. As you lengthen an antenna, you lower it's resonant frequency, and as you shorten it, you raise the resonant frequency.

You will probably find that when the antenna is set for 52 MHz, that you have an acceptable SWR at 50 MHz and 54 MHz. It would be best to try this on the ground first. Try to keep it away from other large metal objects as you try this, and put it up in the air as far as possible. It's best to test it at a wavelength (18 feet) or more above the ground, but you'll get an idea at half that distance.

There are some caveats, as some antennas have quite a narrow bandwidth. I was playing with a friends 6M antenna yesterday. He bought a 6M Diamond marine antenna (I.E. requires no ground plane), and I was quite surprised that it's 2:1 SWR bandwidth was 1.3 MHz. This is an end fed 1/2 wave, with an impedance matching coil at the base. Other antennas like the 3 ring Halo Saturn has an even smaller bandwidth of less than 1 MHz, I believe. I have an MFJ Tri-band vertical, and it has a 3 MHz bandwidth.

Do you have an SWR meter? Your gonna need one to install this properly.

If you plan on only using this on the SSB portion of the band (50.1 to 50.3 MHz), then you can optimize the antenna for this portion of the band. Find a replacement material to play with the antenna, like #12 solid copper wire, or welding rod. That way if you screw up and make it too short, you can replace it easily.

Bob,

I have this same antenna mounted on my chimney. great
antenna !

I extended the longer of the three radials a bit in an
attenmt to make it tune to 50.150.. no go, so I ended
up using a MFJ tuner to tune it to the SSB portion of
6m. With strong E's I worked many NA grids with this
antenna. I now use a Par Omni horizontal loop.

cheers,

Tom

Bob,
tuning the radials of a vertical does not help the vertical radiator at all...All this does is make the SWR "look" better to the radio but as we all know, low SWR does NOT = great radiation (think dummy load for example :)

The Diamond and others which allow tuning the radials all suffer poor design on 6...it may work well in the FM portion where it needs to cover say 52-54 MHz (or MAYBE down to 51 MHz if that were possible with it).. but to extend operation into the 50.xxx range (especially 50.125 and below), that requires the vertical radiator to be lengthened....and thats not possible with their construction (it would screw up the 2 and 440 operations)...You CAN use the antenna in the lower range with the higher SWR...but a true 1/4wave cut to freq would be better....HOWEVER, remember working local/"NON DX" SSB (and other non FM modes) stations on 6 requires you to be horizontal and not vertical; as is the case on all weak signal operations above 50.0 MHz....

All I can say is try it down at 50.1xx...if the radio seems to like it, you can probably use it when the band opens...but for best performance when the band isnt open (out to a couple of hundred miles on six anyway depending on height, power, etc) you need a horizontal antenna...
YAGI at say 50-70 ft would be great....a PAR loop or home built halo or turnstile may be easier on the pocket book...

Enjoy the Magic Band! :)

Looking for Source of SMA (Male) Connectors...

Hello,

I am looking for a source of male SMA connectors to be attahced to RG-58 cable. I would like to use them to build my own antennas for my VX5. I have looked all over the place. I have seen some places that will sell bulk quantities, but none that will sell quantities of 10 or so...

Does anybody have any ideas?

Thanks,
Mark KC8WLZ

I just returned from Grand Cayman where I operated six meters as ZF2FF. I worked very few stations on six, but heard many, many Stateside stations. What this tells me is that six can be open to DX areas and we'll never know it...the key here is to listen very carefully. Hopefully I'll do better next time.
73, Steve - K8FFO - ZF2FF

And a nice legal limit amp would be nice too! :)

Wish I had heard ya. I've got very few contacts on 6m out of North America. I did manage to work the Gallapagos Islands once, the Bahamas, all of the UK and several European countries.

Anyone make any contacts last night via MS? I only had a few minutes to listen, heard two stations but the trail faded before we were able to confirm a QSO, so no joy on my part.

I have owned a 821h for about 7 years and have had no problems with the
radio..works great on 2ssb and 432...don't use it for fm..the radio does more than
I thought it would and am very pleased with it..

3363. SPECTRUM BILL COSPONSORS

Yahoo group: 6meter (2000 — 2003)
Date: 2003-08-17 16:24:03 UTC
From: worksntv@aol.com
Topic: 3363 Message: 3363

I've written my letters via e mail--I suggest all of us do the same ;-)

Bob
WB3DYE

HAYNIE URGES MORE LETTERS TO POTENTIAL SPECTRUM BILL COSPONSORS

ARRL President Jim Haynie, W5JBP, wants to see more letters urging members of Congress to sign on as cosponsors of the Amateur Radio Spectrum Protection Act bills in the US House and Senate. The identical measures, an ARRL initiative, are on their third try in Congress. Noting that cosponsor counts have changed little over the past month and that some lawmakers he's contacted had not yet heard from constituents, Haynie encouraged more League members to take the effort to write, call or e-mail their representatives and senators to explain the bills' importance.

"Those letters are everything to a congressperson or a senator," Haynie said. "Without letters from constituents, we're just spinning our wheels." Conceding that Broadband over Power Line (BPL) has been taking the limelight in recent days, Haynie said passage of the Spectrum Protection Act remains important to the overall future of Amateur Radio.

The Spectrum Protection Act would require the FCC to provide "equivalent replacement spectrum" to Amateur Radio if the FCC reallocates primary amateur frequencies, reduces any secondary amateur allocations, or makes additional allocations within such bands that would substantially reduce their utility to amateurs.

A sample letter on ARRL's The Amateur Radio Spectrum Protection Act of 2003 Web page <http://www.arrl.org/govrelations/arspa.html> cites Amateur Radio's role in public service activities. The page also contains information on how to identify and contact members of Congress and links to the Thomas Web site <http://thomas.loc.gov/>, where the bills' text and a list of cosponsors are available.

"Just bringing the Spectrum Protection Act to the attention of your senator or representative is a major help in this effort," Haynie said. "This is not one of those cases where we're looking for donations. This is something that you--as a member--can do on behalf of Amateur Radio, and the most it will cost you is some stationery and a 37-cent stamp."

Those writing their lawmakers on behalf of the Spectrum Protection Act are asked to copy their correspondence to the League via e-mail <specbill03@...>.

HR 713 now has 44 cosponsors, while the identical S 537 has six. Cosponsorship lends support to legislation while it's in committee, and

Haynie says letters and e-mails from members to their lawmakers remains the key to getting the legislation passed.

3368. from another list BPL

Yahoo group: 6meter (2000 — 2003)
Date: 2003-08-26 14:49:24 UTC
From: worksntv@aol.com
Topic: 3368 Message: 3368

All,
The house where W1RFI has been doing some testing in Emmaus is through an employee of Agere. The EMC committee (which I am a consultant to), under the auspices of the ARRL, has been doing an enormous amount of testing throughout not only the US but also all over the world. BPL has been shown to cause interference even in the "best case" (underground powerlines) to un-usable bands to the radio amateur in other (extreme) cases.

It is clear that Power Line proponents have failed to substantiate their claims that the technology will not cause
widespread interference. As many might know the EMC committee through the ARRL did file comments with the FCC recently that the BPL industry needs to back up its assertions with technical studies and hard data that their technology doesn't cause harmful interference to primary users- because frankly it can't. The FCC, though, is hell-bent on coming forward with any technology, it appears, that supports broadband to the home and in this regard isn't being swayed easily. So, your [individual & club] points/comments there really matter- is the bottom line!

See: http://www.arrl.org/tis/info/HTML/plc/ where we now have alot of information about this. Any further questions please feel free to ask!

Here is my letter to the FCC Commissioners. Their e mails can be found at:
http://www.fcc.gov/contacts.html
==========

Dear Chairman Powell:

As an amateur radio operator, call sign WB3DYE, I strongly urge you to NOT support the proposal before you concerning BPL. This would all but destroy communications below 80 Mhz. Please look at the following link:
http://www.arrl.org/tis/info/HTML/plc/#Video

The American Radio Relay League recently submitted comments to the FCC concerning this matter. I don't have to remind you of the countless contributions the Amateur community has made during national and man made disasters. Emergency Management Agency managers nationwide will all agree amateur radio operators are a vital resource especially in this day and age of terrorism.

Best Regards,

Robert Reynolds

3370. G5RV

Yahoo group: 6meter (2000 — 2003)
Date: 2003-08-27 22:12:24 UTC
From: worksntv@aol.com
Topic: 3370 Message: 3370

I've had a G5RV for a number of years and have made many contacts with the help of an outboard tuner---A manual tuner with my Icom 735 and now the computer controlled tuner with the Icom 706..

I borrowed a friends MFJ antenna analyzer and got the following results---the antenna for all intents and purposes is not resonate on any ham band...I am posting the freqs and various SWR readings I got---Anyone have an idea if I should scrap the G5RV in favor of another antenna? I am limited for real estate and not interested in a vertical.

Here's the info:

Freq- SWR

3.53 4-1
7.56 1.8-1
14.254 2.3-1
19.560 1.2-1
25.054 2.5-1
31.535 1.2-1
36.000 2.0-1
43.560 2.1-1
47.260 1.6-1
59.300 1.6-1
71.270 1.5-1
86.900 1.6-1
153.600 1.2-1

Any help/advice would be appreciated!

73'

Bob

The G5RV is really a 40 meter dipole. If you only need 6m and are limited in space, a 6m dipole is very compact, with the total length being around 9 feet. If you're using a full size G5RV, that doesn't sound like much of a space limitation for me! :)

I have 2 G5RV's and have used only 1 on 6 meters. That antenna is 50 foot and got me into Japan and Malaysia. I used it in 2000 when 9M6BAA was operating and worked 10 Ja's at the time. I also use a shorter 6 meter dipole but not found in the states. Its a Daimond antenna called W215S and is 4.25mm in lenght. It uses 2 bands 6m and 15m but it has high SWR's on 15. The 6m side got me into JA,BA,HL,JT,VU, and a few others. I have worked about 10 countries but made 300 QSO's with the dipole. JT1CO and VU2ZAP were 2 of em.

73's from Manila.

My station as previously mentioned has 2 G5RV's they work good for me but wish they had directional.
My 2 G5RV's are 104ft.<modified> and 50ft.<uses ladder line>. I also use a tuner and thats the MFJ945E, and the MFJ Antenna analyzer . With the longer one I have worked the East coast of the US on 10 meters during the CQ wpx 2001 and have so far made 1950 QSO with the 3 different dipoles.
I have the space for directional antennas but my neighbors and family are nervous of TVI. So far the only antenna to do that is the 6 meter dipole..

I have talked with fans of the G5RV and there are just as many people for it as against. I would go with the 6m dipole if that is all you want. Check out www.theradioworks.com or maybe it is www.radioworks.com down in Va Beach, Va. They have a good web page that might give you a better idea of antennas that you might be interested in. Subject: [WSVHF] W4NH Plans for September

Hello Tom. I just wanted to let you and everyone else know that the W4NH Fourlanders Contest Group will be on for the September contest from our usual location in EM85jm (Soco Bald, NC). One thing new this year is we will be active on all bands from 50MHz through 10 GHz! We will be running legal limit TX power (or close to it) and big antennas on 50 MHz through 432 MHz. Our microwave setup will be a bit more modest since this year is the first time we have done the microwave bands in a while. Please help by getting the word out and letting folks know we have microwaves this year. If anyone wants to make scheds or has any questions they can email me at w4kxy@....

One other thing, don't forget the Fall Sprints starting September 22nd with the 2 meter fall sprint. For rules and other info. go to the Southeastern VHF Society website (www.svhfs.org).

Fall, at least in this area (EM96 north central NC) tends to be the time to repair rigs, build antennas, run that coax, etc. I've heard a few stations and have had a few contacts, but ground wave and Es only. Doubt much will happen until the winter (vernal??) equinox.

So, as a guy who's interested in trying out 6M SSB for the first time,
would I be better off holding on to my $300 for a few months, or should I
dive in now?

No, jump in. One of the the neatest QSOs I've had was with ZF1DC in March (me...8w output and mobile)....and I've had several nice QSOs into Canada in the past weeks. Spring & Fall seem to be a bit slower, but oftimes a signal will pop up out of the noise for a few minutes and a QSO can take place. As I just sold the old Alinco DX70T (10W out on 6) and replaced it with a -TH model (100W), I'm also in the process of upgrading the antenna system (homebrew HexBeam with the PAR Omni relegated to AM w/the Gonset). Hopefully this will give me a decent system for band openings. 6 can be frustrating, but tons of fun during band openings. I almost gave up early on, but patience (not a virtue... a requirement) and a bit of good fortune allowed me to hear that VE1 calling ...and I've gotten around 10 countries so far on 6. Hmmm...any VK's out there??? <<grin>>

Go for it. BTW, if you're springing $300 for a dedicated 6M rig, why not consider one of the multiband rigs for $100/$150 more? The orig. 706 is good, tho a bit deaf on 2M. I'm impressed with the Alinco DX70TH...the receive is almost as good as the MuTek modded Yaesu FT736R I've got (and the amp is now FINISHED!!!! Woohoo!). Rather impressive for a sub $500 rig. As for monobanders, I'd love to find a Drake TR-6 for a cheap price, but I think I could buy the Brooklyn bridge for $100 first (grin).

FWIW, there's a DX70TH on QRZ.com for $400 right now.

Andrew

Well, I figured $300 would cover an MFJ-9406 and any incidentals I'd
need to make it work - like supplies for a homebrew antenna and maybe an
inexpensive power supply. I'm a bit skeptical on buying used.

If you're gonna spend $300, I'd look for a used RCI-5054. They're great
radios. I had one until I bought an FT-100D so I could get on 6m/2m/70cm all mode.
Add a Cushcraft 3 element yagi and you'll be ready! Even a simple dipole would
be ok. They're readily available on Ebay, most very well made, or if you like
to build your own, it's easy to build one too.

That was the approach I took when I started on 6m. I picked up a 9406 for $150 at a hamfest, and turned 20 bucks' worth of copper pipe and solder into a 6m J-pole antenna and stuck it up on a 20' pole. When the band was open it was more than adequate. For a few extra samoleans I snagged a ladderline J-pole from AES, and cadged a 7AH battery from a dead UPS; presto! portable rig for backpacking!

I did eventually become somewhat frustrated by the MFJ's non-immunity to all RFI in my environment (my wife's PC appears to be the source of it) and also wanted to try out 2m SSB and UHF work, so I took MadDrewski's approach and bought a used FT-100. I still use the MFJ portable, though.

Buy from a dealer and get a 90-day warranty. You can get an original 706
for about $500.

There is never a bad time to get a rig on 6 (all mode of course!).....
If you can find a allmode rig like a DX5054 for $300 or on sale (which
they will be soon Im sure with holiday season approaching), that would
be an excellent time to save a little money....but its never a bad deal
to buy you rig and get up and on the band :)

6 IS the magic band

Although fall is sort of a down time for 6 meter ssb consider it sort of down but not out. I had a great opening on Sept. 1st and keep the radio tuned to 50.125 at all times when I'm around the shack.

I started on 6 meters on June 16th this year with a RCI5054DX (25 watts) and a Par Omni Loop at 22 feet. I worked several hundred stations with that setup (all bought new) for less than $400. I recently bought a Icom 706MkIIg because I want to try 2 meter ssb (and will be upgrading to General soon for HF access).

The 5054DX is a good rig and mine will be going mobile soon. I do wish I'd spent the extra bucks on the 100 watt version though. During strong E openings the 25 watts is plenty but on marginal openings the extra watts make a difference on the order of 1 or 2 "S" units by signal reports. It also makes a world of difference on local (and not so local ... up to 100 mile contacts without benefit of E's). I use an Astatic M6 hand mic on the Ranger and it really seemed to make a difference in the audio reports, just don't overdrive it.

The Par OA50 loop antenna is nice. It's cheaper than the M2 version, sets up and tunes easily and seems to take all the weather that Oklahoma can throw at it. I'm still using it although my primary antenna is a 3 element Yagi (at 30 feet) now. I'm due to have a M2 5 element Yagi delivered by UPS today and it will be at 37 feet.

Ham radio station building is always a work in progress and I think that now is the time to get everything together for the winter E season. If you wait until it opens you'll find yourself running coax, tuning antennas, and running ground systems while everyone else is talking cross country. I'd say go for it now.

I'm thinking about what sort of dedicated 6m antenna to put up at my club station (W4DFU, UF Gator Amateur Radio Club). The station's on the roof of a hospital, with a couple of towers bolted to the sides of penthouses. The only really viable real estate is some kind of side-mounted arrangement about halfway up the VHF tower, so I was thinking of either a horizontal loop or a J-pole on standoff brackets. The J-pole would be nice because I've already got one built that I'm not using at the moment, but I'm concerned that being mounted side-saddle on the the tower would bugger up its radiation pattern. I'd hazard a guess that an omni loop like a Par or M2 (or homebrew equivalent) would be less vulnerable to pattern interference from proximity to the tower. Thoughts?

(And YES, it'd be nice to put a 6 element Yagi up but NO it's not an option - the VHF tower's got an az-el satellite array up top, and the HF tower's got that humungous multiband Yagi so it's full to capacity, and the club doesn't have the money or the political capital with the University to put up a third tower (oh how I wish!) :-))

A vertical is good if you work FM OR only want to work decent signals in a band opening.....if you want a GOOD SSB purpose
antenna, you want a PAR or any Horiz OMNI antenna....
Personally I would take the Az-El array OFF the top of the tower...that's somewhat of a waste for a SAT system :) Put that array somewhere where it can see the birds but its not needed on TOP of a tower....put the 6mtr antenna up there (I would go with a PAR AND a 5/8wl grounded vertical...so you cant miss anything)..and the grounded antenna reduces static buildup...

I'd hazard a guess that an omni loop like a Par or M2 (or homebrew equivalent) would be less vulnerable to pattern interference from proximity to the tower. Thoughts?

(And YES, it'd be nice to put a 6 element Yagi up but NO it's not an option - the VHF tower's got an az-el satellite array up top, and the HF tower's got that humungous multiband Yagi so it's full to capacity, and the club doesn't have the money or the political capital with the University to put up a third tower (oh how I wish!) :-))

I recently built a horizontal loop. I based it off of the plans at
http://home.comcast.net/~buck0/6m_halo.htm

I used copper instead of AL.

Total cost about $40, including some parts bought from Radio Shack

I installed it in the attic and so far it works GREAT.
Let me know if you would like for me to take some pictures and do a
short write up.

I'm thinking about what sort of dedicated 6m antenna to put up at my
club station (W4DFU, UF Gator Amateur Radio Club). The station's on the
roof of a hospital, with a couple of towers bolted to the sides of
penthouses. The only really viable real estate is some kind of
side-mounted arrangement about halfway up the VHF tower, so I was
thinking of either a horizontal loop or a J-pole on standoff brackets.
The J-pole would be nice because I've already got one built that I'm not
using at the moment, but I'm concerned that being mounted side-saddle on
the the tower would bugger up its radiation pattern. I'd hazard a guess
that an omni loop like a Par or M2 (or homebrew equivalent) would be
less vulnerable to pattern interference from proximity to the tower.
Thoughts?

(And YES, it'd be nice to put a 6 element Yagi up but NO it's not an
option - the VHF tower's got an az-el satellite array up top, and the HF
tower's got that humungous multiband Yagi so it's full to capacity, and

the club doesn't have the money or the political capital with the
University to put up a third tower (oh how I wish!) :-))

Bruce: Will you be working SSB or FM on 6? Assuming SSB go with the loop. It won't "see" the vertical tower metal like a Jpole will (assuming you're mounting that vertical) and will be less affected. And you can mount and phase 2 loops to get some gain.

In a message dated 9/5/03 8:57:53 AM, rcrane@... writes:

<< Well, I figured $300 would cover an MFJ-9406 and any incidentals I'd need to make it work - like supplies for a homebrew antenna and maybe an inexpensive power supply. I'm a bit skeptical on buying used.
-Ray>>

Hmmm...lemme see now....I've bought a new SWR bridge or two...two antenna matching devices ("tuners") and the occasional other bit or piece. Everything else is "experienced." I've got the MFJ-9406 (K1BQT's personal unit...he designed it and MFJ bought the prod. rights...mine's got squelch and CW) which is OK for portable work (easy on batteries) but not a good rig for a beginner. Read the other suggestions, look around, couple of rigs are close to your price point. As for antennas, the PAR is a good start, the Cushcraft A3S50 is not bad for a 3 ele yagi...but you can build a cheap loop for a few bucks. However, DO GET GOOD COAX!! I scrapped all the RG58 I had, went to 9913 and LMR400 for all the VHF/UHF gear. Best money I spent! Use at least RG8X. Lots of 6M antenni plans out there....even a J-Pole will get you started ($20).

$400 for a multiband rig, $50 for coax and some copper, and you're on the air. There is a horiz. loop design on eham or qrz, cheap and neat. That would be the best starter antenna, use it for monitoring after you get the $600 HexBeam up! (kiddin') With the MFJ, you will either need to homebrew or buy an amp eventually....add $150 to $250 for that, and you might as well get one of the multiband rigs. Also, you get HF for WHEN you upgrade (hope springs eternal.....).

Hear you on 6!

Cheers;

Celwave made an antenna made to mounted on a tower that works well for 6M.

It a PD320 (Was actually made by Phelps Dodge). It has 2.5 dBd gain over a dipole away from the tower and a -5dBd on the back side of the tower.

I have one on my tower and love it for a second antenna. Here is a picture of one. Not mine though.

Nuke Engineer-

Thanks for sharing your data with me. It appears the Comet only has
about 1meg banwidth @ < 1.5:1 and doesn't want to tune below 51MHz.
Did you try changing the length of the radial for ssb coverage?

Jim

DB212 series are also designed to work against a tower/mast (any half wave dipole or ground plane will work if spaced right) but again, for SSB work locally and non DX wise, you need horizontal..

chris
you just cant drive home the idea hard enough to these guys that they need horizontal antennas they are use to 2 meter FM where the one antenna works the hole band
one of these days i plan on putting up a loop and a vertical to go along with my 6 ele yagi so i can cover all aspects of 6 meters
good luck and keep preaching to them on the benifits of horizontal polarization

Many people don't have room for 2 antennas.

I have an MFJ-1536 Tri-Band vertical (50/144/440 MHz) 60' up in the air. I set the resonant point on the lower part of the 6M band, and still have an acceptable SWR (2:1) on the FM portion of the band. I use this antenna for AM, FM and SSB on 6M. I have 20 states, 4 Canadian provinces, and 100+ grid squares from this antenna on 6M in 2003.

When 6 is open, you can talk on just about anything.

3405. quickest cheapest antenna

Yahoo group: 6meter (2000 — 2003)
Date: 2003-09-06 15:53:10 UTC
From: Ray Crane
Topic: 3405 Message: 3405

Anybody have any thoughts (links?) on what will be the cheapest and quickest to build horizontaly polarized 6m antenna? I'm planning on picking up a RCI-5054DX today and I'd like to get as quick a fix as possible. :)

Also, is RG8X the way to go on coax? If I buy something better (what?) would it be interchangable with the 8X, or would I have to modify antenna plans to compensate for different feed coax?

-Ray

3406. Re: [6 Meter Sked] quickest cheapest antenna

From: Dennis Kaylor
Topic: 3405 Message: 3406

check www.ac6v.com and look at the antenna projects link he has a wide
range of antennas
as for coax RG8X would be fine for a short run less than 50 feet
i would suggest either 9913F or LMR 400 which are RG8 types for runs
over 50 feet
check your local hams to see if they have any peices of aluminum tubing
and make yourself a dipole its 54-56in long each side of center
cant get much cheaper than that
good luck

From: Christopher Boone
Topic: 3405 Message: 3407

Two ways...

1/2wave standard dipole...(made out of any radiating material) I would
put up two (one at 90deg to the other) since a simple dipole has NULLS
off the ends (pattern is figure 8)
OR
1/2wave V dipole made of two whips and bent back in 45 deg angle
in H place (so it gives you somewhat omni coverage)...Yes you could do
this with wire but it takes 3 supports, all at the same height...or
you can do such a dipole with CB style whips cut down and mounted back
to back with coax feeding them in a normal dipole config...then bend the
whips back to get a V shape in the horiz plane (I did that and it works
fine).

The mounts used to hold 2 "Hamsticks" as dipoles work real good for
this...just go to Radio Shack, get two 102" CB whips, cut then down to
56in (measure up from the bottom of the threads) and screw them into the
mount; probably have to order it unless you have a ham dealer in
town...then bend the whips back at 45deg angles and put in the air on a
mast......and enjoy...(56inches on each end is resonant at the low end
of the band..50.14MHz... and will work fine)

RG8X? Nope....almost as lossy as RG58.....go with regular RG8 or even
CATV hardline (the SWR wont hurt...just trim the line NOT the antenna
for best SWR)...can make simple connector for CATV line using BRASS
plumbing compression fittings and PL259s :)

[Scot Clayton] Jim, I'm on my second one, and I would highly recommend the unit. It's a VERY nice rig, and have NO bad things to say about it at all. If anything, I'd say that I don't like menu type controls, etc. but that is the way things are with all rigs nowadays, especially small units like the 706! Good Luck!

You might save a little more and get a radio like the FT100D as they get out on 6,2 and 432. The last I seen a price on it was around $800.00 It puts out 100 watts on 6 (you can lower the output),50 watts on 2 meters and 20 watts on 432. look around at the other Companys too as They have radios that might be as good. (I've started out with Yaesu and never got any other Brand!) HA I purchased the FT100 and the FT736R in 93 and never a problem so you can go from there.

There is never a bad time to get a rig on 6 (all mode of course!).....
If you can find a allmode rig like a DX5054 for $300 or on sale (which
they will be soon Im sure with holiday season approaching), that would
be an excellent time to save a little money....but its never a bad deal
to buy you rig and get up and on the band :)

6 IS the magic band

Jim: I purchased a 706MkIIg less than a month ago. I'm very impressed with it. I've gotten good signal reports on a couple of openings on 6 and worked my first 2m ssb contacts last night and this morning. The radio is jam packed with features and the menu system is easy to learn (much easier than my Yeasu 8900r). I think you'll like the 706 too.

Hi Jim!
I have had many radios and I suggest you to forget 706. It is a good receiver, but it don't last transmitting, because huge heating problems. Nowadays I have Yaesu FT-897 which is far more better. It is just my opinion.

BR,
OH8GCW

Jim,
I have a MKII (no G). Never had any problems with it. Use it on a screwdriver ant and the foldback circuit lets me tx even if the ant isn't tuned right. No heat problems here, even with lots of final abuse. Can't wait to get a "G".

Topic: 3405 Message: 3417

Ok, so I bought a 5054DX and constructed a dipole from 1/2" copper pipe.
So far the only thing I've managed to tune in is some CW on 50.0642 or so.
(Sounds repetative, a beacon I guess?) My problem now is transmission.
I'm not entirely sure if I'm making correct use of the 5054DX's internal
SWR meter (anybody familiar with this unit have any tips?) but it *seems*
like its showing SWR off the scale. I think what I need to do is trim down
both ends of the dipole to give less length, but I'm not sure, and like I
said I'm not even sure if I'm reading the SWR correctly. Anybody have
any advice?

I'd recommend you find a local ham with either an SWR meter that works
on 6 meters, or even better, a ham with an MFJ Antenna Analyzer.

Try this site:

http://www.brainz90.plus.com/coaxdpl.htm

This is a calculator for the dimensions of antennas built entirely of
COAX! Definitely simplifies the search for materials.

Usually the "SWR" meters in ham rigs (and CBs for that matter) are simple bridges....you have to "set" or calibrate the fwd or 100% scale first before they read "correctly"...if you have a 50ohm resistive dummy load, put that on the radio and see if it reads 1:1 or close...Another way to check the antenna is check FORWARD power out across the band in CW mode..the SWR protection in the radio will fold back the power when the SWR goes higher than the radio wants to see...If your forward power peak is around 50.1 or so, you're ok...

the beacon on 50.0642 could any of the following:
50.063 KF4ODI f/wave loop 10 EM 56 HA TN
50.063 WB2AMU FN 30
50.063 N4PZ 1/4 Whip 0.4 EL 87 Wheaton
50.063 KB6BKN 4 Elm. NE. 30 CM 88 Novato
50.063 W9JN Halo 1W/10W EN 54 DN WI
50.063 KH6HI EL 59 HI
50.0635 K7UV Horz Loop 25 DN 31 XM UT
50.064 N7ML DN 45
50.064 N7DB CN 85 Boring
50.064 WB4IJY EM 79 Florida
50.064.5 W0MTK Dipole 2 DM 59

It should send a few V's then the callsign and grid square...(callsign/B is always a beacon ;) If you made the length of the pipe correct (approx 56in from center to ends) and connected the coax properly, there should not be a problem..
Now to catch the next opening :)

Aren't there any 2m repeaters in your area? If so, I am sure if you just ask someone there, they can help you. Otherwise, you can go to the ARRL website and look for a local club near you. They usually have contact information for local clubs.

On 6m, a wire dipole is simpler/cheaper...don't need to worry about
bandwidth since most SSB activity is in the 50.1-50.2 range..
on HF, a wideband dipole such as the one below is better than a wire
dipole because of the % coverage of a HF band..
but coax cost more than simple wire :)

Oh, I'm quite sure I can find local hams. There's a club that meets
up the street from me in a couple weeks that I intend to check out.
Maybe its just me, but "Nice to meet you, will you help me analyze my
antenna?" seems a bit strange. Advice over email is, of course, a
different story - and by the way, nice to meet all of you and thanks
for the help. :)

Although I don't know code, I managed to hear the three letters repeating
and look them up. Indeed, three Vs. A beacon! Now, if I listen to the rest
of the letters a few thousand times maybe I can decode the whole thing. ;)

> If you made the length of the pipe correct (approx 56in from center to ends)
> and connected the coax properly, there should not be a problem..

I cut the pipes to be about 56in. I used some spare wire to jumper between
the coax and the pipes, maybe three inches on each side. Do I need to count
that against my total length, and therefore cut down the pipes some?

I verified with a multimeter that there's no connection between the two
pipes, and that the left pipe has connectivity to the coax shield and
the right pipe has connectivity to the coax center conductor.

The pipes are held in the center with a 3/4" PVC tee, with adapters on
each side down to 1/2" - this results in some minor sagging. Shouldn't
be a problem, should it?

That or a good CW decode program for the PC :) There are some out there
on the Internet available for free.....you could search for them under
Google.com

> I cut the pipes to be about 56in. I used some spare wire to jumper between

> that against my total length, and therefore cut down the pipes some?

Yep!! The connection from the feedline to the antenna elements should be
as SHORT as possible (preferably under an inch)...with 3 inches either
side added in your dipole will be resonant WELL down in the 49 MHz
range..not the 6m band. Try to Y the coax and attach directly to the
pipe elements...I would get the elements closer together if you
could...by the description below, it sounds like they could be several
inches apart..keep the spacing down so your coax connection will be
short..as long as the the elements are ~1/2in apart, there wont be a
problem..

> I verified with a multimeter that there's no connection between the two

Naw...slight sagging wont be an issue....I would look at replacing the
3/4in T with a 1/2in T and remove the adaptors if possible...that would
get the elements closer in....on HF, the gap on a dipole center is not
that critical due to % of the wavelength...but above 50 MHz, it can get
to be that way!

hi ray
first off 6 meters isnt like 20 where you can turn it on and expect to
hear activity all the time it just doesnt work that way
secondly go down to radio shack and by there cheap CB SWR bridge it will
give you close enough accuracy even though it wasnt designed for 50 MHZ
it will still work i have used one several times just make sure the
power is on the low side
and you will be fine
and that CW you was hearing is a beacon
good luck

I bought one of those cheap SWR meters at a swap meet for a couple dollars.(It is the kind you have to calibrate the needle swing each use.)I used it to set up all of our mobiles and the 6m station. A couple months later I borrowed a friends expensive MFJ VHF SWR meter to check my work. They were so close I didn't worry about it.Like Dennis said just use low power.

I have an old Radio Shack (Micronta?) SWR meter thats spec'd for 144&440,
would that work well enough on 50mhz to be useful?

Something else you might want to try is checking into a local net on your 2m repeater and when they ask you for comments, mention that you're looking for some assistance with a 6m antenna and request anyone interested to contact you after the net. It's not quite the same as walking into the room and asking for help. It leaves it open for those that want to help you, rather than those that feel obligated because you asked.

I was out of town this morning near Baltimore. I had my car stereo tunes to a local baltimore FM Station. I was hitching up my boat and noticed that the station was a listtle fuzzy. Then to my surprise, I found I was listening to a station from Raliegh, NC. Thats 500 miles. Then poof...gone. Thats about the best shot I've ever heard on FM broadcast band. 100-200miles isnt so unusual, 500 is a record for me. Was there any other VHF conditions in the mid atlantic area Sunday morn? What did I miss?

3436. RE: [6 Meter Sked] swr, etc.

Yahoo group: 6meter (2000 — 2003)
Date: 2003-09-08 11:46:50 UTC
From: M Gollihue
Topic: 3405 Message: 3436

Well, last night I was getting in WAVE channel 3 from Louisville, Ky.
crystal clear from about 7pm on in Dayton, Oh. so 6 must have been open!
Wish I'd had a radio hooked up...

Mike, N8CBJ

From: M. Walton
Topic: 3405 Message: 3437

Thanks john,

I had never seen this tool before. Very useful. I looked at yesterday's map and can see that those condx exsisted. Even stronger to other areas. I monitor 2m for such openings regularly, but had dont usually here much in the broadcast band, especially that far. My location there is about 30 ft from the Chesapeake Bay. I should make it a habit to check this more often.

Thanks Again for the link.

These are great maps. I gaze at them everyday and it seems most times I'm holding a U on top of my antenna! I'm in DN 23 and things are awful quiet overhere, I sure hope winter brings some openings.

Speaking of SWR, I have the current offering of Radio Shack's SWR/power meter and it seems to work ok on 6 even though it's advertised as 3 to 30mhz. Price is good to at roughly $30. What would the differences be in a meter to cover above 30mhz?

I have no 6m gear at my weekend location. I just got set up on 6 for the first time in 27 yrs of hamming. Been waiting for an opening here, but nothing yet. Dont have the greatest antenna, dipole. Have not decided what or where I want to do about the antenna yet.

The best thing for you to do would be to borrow an SWR meter that is rated for 6m and put it in-line with the 3-30mhz meter and see what the difference is between the two meters. I used to have a meter like yours from Radio Shack and I remember there being adjustments inside for the meter, so you might be able to get it to show a more accurate SWR/power level on 6m.

HF SWR meters use a shielded box, with 3 close proximity wires, and 2 RF diodes to determine power levels going in each direction. The diodes determine the upper frequency limit of the meter, as does the configuration of the wires. RF diodes have an upper frequency limit, where they are unable to rectify the signal above a certain frequency. What will happen is they will first exhibit lower rectified output, and then just stop working as you raise the frequency. Since SWR is a ratio between the forward and reflected power, as long as the diodes exhibit similar properties, and are still rectifying, the SWR will be fairly accurate within the confines of this type of measurement (another long story).

Be aware that you can actually fry the diodes if too high of a frequency is applied, and/or too much power is applied.

I have found that all of my cheap CB SWR meters work fine on 6M, most on 2M and some even higher (My Vanco works well on 450, and is relatively accurate). The biggest problem is that the wires in the box can become resonant at specific frequencies, and throw off your readings. I have not found this to be a problem on 6M, and I also have a Bird 43 to compare thing against.

If you have some space up above (i.e., you're not in a condo), try a cheap quad. Mine uses the fiberglas shafts from driveway reflectors (from the Great WallMart of China..try to find something US made there....)...popped the shafts out, drilled a piece of PVC for the hub and ran some wire around them. Works fine. Did a similar deal to make a homebrew HexBeam. Haven't fully tested that one yet, but seems to work better than the PAR. A 2 ele. quad should be easy to build with some PVC pipe, #14 stranded and a few couplings. Google can help you locate several plans. Armstrong turner or RatShak/Alliance rotor will complete the setup. Light, cheap and decent gain!

Andrew

Topic: 3443 Message: 3443

For the longest time I used a dipole cut to 50.125.
I worked on that for a long time. I got it down to 1.2 that worked great.
However for Field Day this last year I purchased A Cushcraft A50.

I still have the 3elm. beam I used on Field Day... Used once...

Set for 50.125

I can't use it here at home. I will sell it for 2/3 of the cost to me.

A Cushcraft A50 3 elm beam, set for SSB operation U pay shipping.

$65.00

Tnx Andrew,

I was concidering either a quad or a 3 ele yagi. I built a single element quad for 10m a few years ago and it worked great. If I can find something inexpensive, I might buy one. If not inexpensive, I'll build one. I have a bout a month left here till the cool weather sets in. Hope to get my antennas all ready to go by then. I'll take a look around and see what I can find.

Tnx 73

If you have some space up above (i.e., you're not in a condo), try a cheap
quad. Mine uses the fiberglas shafts from driveway reflectors (from the Great
WallMart of China..try to find something US made there....)...popped the shafts
out, drilled a piece of PVC for the hub and ran some wire around them. Works
fine. Did a similar deal to make a homebrew HexBeam. Haven't fully tested
that one yet, but seems to work better than the PAR. A 2 ele. quad should be
easy to build with some PVC pipe, #14 stranded and a few couplings. Google can
help you locate several plans. Armstrong turner or RatShak/Alliance rotor
will complete the setup. Light, cheap and decent gain!

Andrew

Tropo is not as common here. Like I said, summer mornings 100+ miles on 2m is not that unusual. Thats about the most I've heard on FM broadcast also. I live about 80 miles north of Balt. I guess it's possible that the large body of water next to me (Balt) may have had some impact on VHF propagation that I'm not used to. It is also much flatter down there. Where I live it is not very flat. So I guess I'll have to do some more tuning around on the weekends down there and see what I can hear.

Between Houston and Dallas, the ducting can get very bad....one of my former stations (KDMX 102.9) in Dallas was always getting on channel interference from the Houston 102.9 (which is owned by Hispanic Broadcasting)...I could SEE the tower through binoculars from the 12th floor studio, yet people 10 miles due east of me in Garland, TX were hearing the Houston FM from 200+ miles away (right up the Trinity river valley!)

Ahhhh the fun of propogation....

BPL is supposed to range upwards of 80 mhz. Wonder what the guys at the airport will do when the outer marker is blanked out (~70 mhz). "oh, dang! THERE's the runway!"

I like the "Dilbert" solution....broadband over sewer lines.......heh.

Rather quiet here in EM96/Central NC....a few local contacts only....but, don't forget, ARRL contest this weekend...from the ARRL website:

1. Object: To work as many amateur stations in as many different 2 degrees X 1 degree grid squares as possible using authorized frequencies above 50 MHz. Foreign stations work W/VE amateurs only.
2. Date and Contest Period: The second full weekend of September. Begins 1800 UTC Saturday and ends 0300 UTC Monday (September 13-15, 2003).

Hope to hear you on 6 and up!

I just found this list and wanted to send a small hello.

My name is Pat St. Jean, K0OOK. I'm in Lewisville, Texas EM13. I've got an IC706Mk2G that will be attached to an M2 6M3 up about 25 feet on top of the garage roof. Right now the tripod's up, but I'm still debugging the rotor, so the antenna's on the ground. Hopefully this weekend it'll be up.

Hope to hear some of you on the air soon!

Pat

The FCC seems to have changed roles.. from that of "regulator and steward of the people's spectrum" to that of "industry cheerleader".

File comments with the FCC on any and all active BPL petitions. Do not be intimidated by all the legal-style briefs that are filed. Filing a comment is VERY easy to do with the FCC's on-line comment filing system.. Just needs the proceeding number, your name and address, and you can even use the text box in their on-line form - eliminating the need to prepare a separate document (text file, Word or Excel).

Just be sure to spell check your work and use at least civil grammar.

See the ARRL web site for info: www.arrl.org .

73, Frank

Topic: 3452 Message: 3463

Are you saying the kings appointed to power by the dude that (in theory) won the last presidential election are crooked??

Now maybe I am just looking too hard at this, but hear out my train of thought.

1. Power companies would make more money with BPL than they do with only electricity.
2. Power companies are big customers of oil and coal mining companies.
3. The current administration is all oil people.

Conclusion - heck yea there are payoffs due if BPL passes. Public interest?? This FCC is obviously not for that at all - we are talking about the same people that think it is OK for one company to be allowed to buy all broadcast (AM, FM, and TV) and newspaper outlets in any given market. Oh yea also they think it is good if one media company can control up to 50% of the national market. Next on the _______ News Network, 500 commercial free hours of BRAINWASHING! Stay tuned because all the channels are the same! We can be just like Cuba, only with more natural resources (and a less hairy president...hopefully anyway).

You can fool some of the people some of the time. I for one can not wait till the public wakes up and sees through the smoke of "national security" for what is really going on - a concentrated attack on EVERYTHING in the name of higher profits for the people that own all the stock.

Now do not get me wrong, I am all for protecting what we have but there was a man who once said "he who trades liberty for security deserves neither". Oh and in case anyone thinks this man is a crack head, his signature is on the original copy of the US Constitution. He might have even written the Declaration Of Independence (I cant remember if it was Franklin or Jefferson who said this...sorry).

I would like to see BPL stopped dead in its tracks. There has to be a better way of providing broadband than a crackpot scheme that would wipe out a slew of radio services - not just ours.
The good thing is that the public, for whatever reason, seems to not know anything about BPL. Most of the comments made to the FCC were anti-BPL. If BPL does pass, we will all know that the fix was in, and the vote was made before the deadline for comments expired. Lets just hope the vote was NOT made in FL with those old machines!! The last thing we need is "Revenge Of The Chads", unless of course the revenge is in our favor :)

-- James KF4OUI

can you imagine the FCC being so blind sighted to allow this to happen?
just look at the NON ham interested being affected the government uses
stuff in the 30mhz and the 60mhz and the international broadcasters
so if this passes something tells me large amounts of money crossed
someones palm to get the go ahead

It was Jefferson, and the full quote is:
"He who trades liberty for security, deserves neither and will loose both"

This one is simple, and no crazy conspiracy theories!

BPL is supposed to be a solution for rural users. Us city folk have the luxury of updated phone lines, many large metropolitan areas have invested in fiber lines into neighborhoods. This means we city people can have cool stuff like ADSL.

Now the rural folks....well they have old stuff. They are doing good if they can connect to a dialup ISP at 28.8k. It is too expensive to run a fiber line down some country road for miles just to connect 5 or 6 homes. However, EVERYONE has electricity. No need to run expensive fiber lines!

True BUT at the same time, with the interference it causes, guess who won't be watching TV channels 2,3,4,5 and 6 anymore ?? The folks outside the city who still depends on over the air TV (of course the FCC will tell you DTV will fix that...yeah right! :) What a crock...BPL is NOT needed for the rural areas...it is a mistake...for all areas!

BTW I used to work for a power company in the telecom dept...their fiber runs are mostly along the high voltage transmission lines (128KV and higher), NOT the lower voltage distribution lines that run near homes, etc...however, in a lot of other areas, they STILL have to depend on leased ckts from the Telcos or something else like microwave or UHF/900 MHz radio (imagine that! ;)

so James is correct in the costs, etc of fiber to the home....
it just aint gonna happen.....BUT then the cost of cable or anything else has been a hindrance to rural areas...WHY should Internet access be any different?

I KNOW about how well my electric company maintains it's lines(OG&E). S7 to S9 noise for the past week and a half on 6 meters. I can even hear the arcs up into the 2 meter band. No one will return my calls about the problem. I guess with BPL we'll all have to live with the same noise I've got now. At least it happened in September and not June / July when the band wide open.

I have a question about BPL. Since it has the potential of interfering on the ham bands, won't transmitting on the ham bands affect the performance of BPL? Not that I'm suggesting intentional interference, just active haming in the BPL areas. :)

i was thinking about the science fiction with bradbarry i think it was. he
had a story about a guy who murdered his house. seems the house was all electric
and computers and he somehow shot it or it killed him and kept on going by
itself. seems like we hams are at that crossroads whether to take interference
or shoot the powerlines. i was wondering if the fcc knowing of the interference
problem are using it to their advantage? maybe they think no terriosts can
get through and the fcc can take care of the jeffery dammer they created in the
70's that being the cb radio section. they need to coral the jeffery dommer cb
section so they allow something to cause interfernce to these arreas but
maybe the government have radios that can somehow pull through the mess abnd still
communicate to each other just fine. also think of this maybe the government
sees broadband over the powerlines as a communication device they can use as
something secret, but it appears as broadband to the public. i live in nampa
idaho. we don't have dsl. it is weird because nampa is about 50,000 people and
caldwell is about 30,000. i would readily give up dsl anyday if it screws up my
hobby. don

Not necessarily true.

The federal government made it quite attractive for rural telephone companies to offer ADSL service to rural customers in the form of grants and formulas for rate setting to recover cost of DSLAMS and modems for ADSL service. I know. I used to help sell the stuff before the market tanked.

If BPL has the _potential_ to disrupt aircraft navigation, has the FAA been involved? It would be interesting as I live in the LA basin (Redondo Beach) with 5 major airports and quite a few munis all around.

As far as the power companies and fiber - not in my neighborhood. The power tree is exactly in my backyard so I can see what is on it - electical, cable, telephone - no glass. The local power company has come close to bankruptcy, too, so I don't see them investing in fiber to the curb anytime soon to monitor their endpoints.

The transmission facilities, here, are very noisy to begin with due to the salt fog that comes off the beach, settling on the power lines and insulators. I actually receive the noise late night and early morning on my 2.4G video rebroadcasters.

Probably dont need the balun....does it work on 6 anyway?? most DONT! They stop at 30MHz or so..
Best to leave it in horiz mode...if you make it an inverted V, it becomes vertically polarized...
Take the dipole, support the center and then have the legs go back in the Horiz plane at 45 degress
(makes it look like a V lying flat; from the ground it will look like a V if you look UP at it from
directly underneath)....this will give you somewhat omni coverage.....you can work locally better
this way....cross pol does not affect you when the band opens but it causes your LOCAL coverage to
suck..

Topic: 3474 Message: 3476

I am currently using a dipole for 6 meters. I just started this 6 meter project about a month ago. Been a ham for 27 yrs and never operated 6. So far, with this dipole, I've made one contact. I monitor 50.125 about 6+ hrs a day off and on. I'm not real happy with the performance of my antenna.

My question is: I would like to put up a better antenna. I am thinking about a 3 ele yagi. The problem with my lot is that I am practically in the woods. Lots of trees, but I'm not sure how much sig absorbtion there is at 50 mhz. I could probably find a hole in the trees to put the yagi. Does anyone have any ecperience with this antenna. I usually dont buy antennas, but my free time for the next few months is limited and I would like to get something up before it gets cold.

I'm open to suggestions. I really dont want to spend more than $100 on the antenna if I buy one. I have a rotor. No tower. 30 ft mast with a 2m vertical on top. HF wires coming off the mast at differewnt points. I do have a 2 meter beam at about 20 ft. I dont use it at all. It is not rotatable. Anywhere you go on my property, you are surrounded by trees.

Comments?

Mark: A 3 ele yagi is good for 6 meters when the band is open. It's wide beam pattern makes aiming a lot less critical than longer boom (and more element) beams. I've worked a lot of contacts with a simple and small 3 ele yagi. Trees will block some of the signals but from where my beam is I have to go through a large maple tree to work NW and I've made a lot of contacts in that direction. Maybe not as many as other directions but you'll still get out. Doug Huchteman KD5VHZ EM15

Agreed....3 el yagi is better than dipole anyday for weak signal work :)
And cheap enough....put it as high as you can and enjoy..maybe modify
the dipole to a cross dipole for local monitoring...(doesnt hurt)

Thanks Doug and Chris,

I know the folage effects my 2m. Having very little experience with 50 mhz, didnt know if that was a big factor or not. I'll probably get the Vectronics. $69, cant beat that. The biggest problem for me is going to be figuring out how to turn it. I might have to do with it stationary in one direction for now. If I really feel brave, I'll lower the mast and put it under the vertical. It's a telescoping mast and hasn't been touched in years. What is a safe distance to seperate the 6m antenna and any other antennas? While I'm up there, maybe I'll put the 2m on the rotor also. Then I could take down the vertical. Is 3 ft enough seperation between the two yagis? Will probably go vertical with the 2m yagi. I dont work any 2m sideband.

3482. Re: [6 Meter Sked] 6 m dipole

Yahoo group: 6meter (2000 — 2003)
Date: 2003-09-11 01:09:43 UTC
From: Christopher Boone
Topic: 3474 Message: 3482

I've mounted verticals above horiz with only say 6 inches or so to spare...make sure the 6mtr antenna SWR doesn't change because of the 2m antenna...and you will be ok....never have dealt with the Vectronics...so cant speak on its construction or how well it performs.. $69 cant be beat unless its junk :) but I doubt it is....

6mtr is not affected as much by foliage as the higher bands are... used to work on lowband (48MHz) VHF for a living.....got some great mobile to mobile and mobile to base range....noise (static type) is your biggest problem on 6...especially from power lines, etc..also any TV 2 in the area?

Welcome to the last bastion of a true "gentlemen's band" :)

From: Keith Beckmann
Topic: 3474 Message: 3484

Don't get discouraged with 6. When the band is open, it's phenomenal, when it's closed, it's boring. A simple dipole is fine for DX work, you just have to wait for the right time.

You might want 2 dipoles. One facing North/South, the other East/West as dipoles have dead spots. Halos are omni-directional and horizontally polarized.

6M seems to die off when it gets cold, but there should be a few more good DX cycles left before is goes south for the winter.

3485. RE: [6 Meter Sked] 6 m dipole

Yahoo group: 6meter (2000 — 2003)
Date: 2003-09-11 01:22:03 UTC
From: M. Walton
Topic: 3474 Message: 3485

No Channel 2. Cable 2 ia already lousy and nobody watches it. I'm only running 10 watts at this point. TenTec xverter on a TS450. I've got my eyes open for an amp, but it's not really important. Antenna is much more important. I've not got much VHF experience other than 2m FM. And I rarely use that. Always been an HF op. I'm always looking for new adventure and 6m fits the bill right now. Trees are a good thing when running HF wire. Maybe next spring I'll break down and put up a small tower. I dont trust this whole mast setup. Thats why I've been hesitant to mess with it. I remember how hard it was to pull that thing up with the antennas on it. 2 inches at a time with one hand while hanging on to the ladder for dear life with the other hand. I am much more comfortable with 2 feet on the ground.

As it turns out, the Vectronics (MFJ) antenna is only sold directly from MFJ. I was hoping to be able to pick one up locally.

Thanks for all the help, I'll keep you posted on this project.

Huh? Winters are supposed to be cold??? Someone ought to send nature a memo to remind it about South Florida. I will be lucky if it gets cool enough to make the skeeters vanish so that I can enjoy the everglades.

Not that I am complaining....no snow to shovel :)

Anyway, yall that have to deal with the frozen north might want to get your club together, and plan a trip. Do not forget a radio and a simple antenna system (and a fishing pole). This way, if you do not catch a opening you might still snag an aquatic critter or two.

3488. Re: [6 Meter Sked] 6 m dipole

Yahoo group: 6meter (2000 — 2003)
Date: 2003-09-11 02:25:54 UTC
From: Tim Kemp WB4BAH
Topic: 3474 Message: 3488

No separation between the vertical and horizontal yagis is necessary.
If the booms are similar in diameter, you can take the elements off the
shorter boom (carefully keeping a list of all spacing betwwen elements)
and mount these elements on the longer boom. This way works well. I
have done it several times putting Cushcraft 2 meter 11 element vertical
elements on the same boom as a Cushcraft 6 meter 5 element horizontal.
Worked fantastic.

Also doing this does not screw up the radiation pattern whereas mounting
the vertical just inches above the horizontal effectively adds a ground
reflection just below the vertical elements decreasing ground wave
coverage by "bending" the forward lobe and diverting more of the
radiation skyward.

Other advantages are that it considerably reduces weight and windload on
your mast and it gets the horizontal beam slightly higher.

The only disadvantages I can see are that:

1) you might have to work on the 2 meter element clamps a little to get
them to fit the 6 meter boom if the diameters are different
2) if the boom seems to be lacking in strength you might want to use
some type of cord that holds up well to sunlight and weather to connect
to each end of the boom and across a slightly higher top of the mast to
help support the added weight of the extra elements on the boom. I have
never found this necessary but I am not familiar with the beam you are
considering.

Thanks for the info Tim. I'll have to take a look at the antenna when I get it. I think the boom is actually longer on the 2m. I really dont need the 2m yagi. It hasnt had a coax attached to it in years. I'll have to pull the whole mast down and see what I can come up with. All I do with 2m is monitor .52 off the vertical. I might just take all the 2m stuff down and concentrate on the 6m. 2m FM really doesnt give me much of a thrill. If it looks doable, I may try your suggestion. I have to get both antennas side by side and check it out.

tnx agn
Mark

3490. RE: [6 Meter Sked] 6 m dipole

Yahoo group: 6meter (2000 — 2003)
Date: 2003-09-11 02:32:18 UTC
From: brian gunter
Topic: 3474 Message: 3490

look at radioshack for a light tv rotor if they have
one it should be cheap and it should work.

= = = Original message = = =

Thanks Doug and Chris,

I know the folage effects my 2m. Having very little
experience with 50
mhz, didnt know if that was a big factor or not. I'll
probably get the
Vectronics. $69, cant beat that. The biggest problem
for me is going to
be figuring out how to turn it. I might have to do
with it stationary in
one direction for now. If I really feel brave, I'll
lower the mast and
put it under the vertical. It's a telescoping mast and
hasn't been
touched in years. What is a safe distance to seperate
the 6m antenna and
any other antennas? While I'm up there, maybe I'll put
the 2m on the
rotor also. Then I could take down the vertical. Is 3
ft enough
seperation between the two yagis? Will probably go
vertical with the 2m
yagi. I dont work any 2m sideband.

Mark

Agreed....3 el yagi is better than dipole anyday for
weak signal work :)

And cheap enough....put it as high as you can and
enjoy..maybe modify
the dipole to a cross dipole for local
monitoring...(doesnt hurt)

Doug Huchteman wrote:

> Mark: A 3 ele yagi is good for 6 meters when the
band is open. It's
wide beam pattern makes aiming a lot less critical
than longer boom (and
more element) beams. I've worked a lot of contacts
with a simple and
small 3 ele yagi. Trees will block some of the
signals but from where
my beam is I have to go through a large maple tree to
work NW and I've
made a lot of contacts in that direction. Maybe not
as many as other
directions but you'll still get out.

3491. RE: [6 Meter Sked] 6 m dipole

Yahoo group: 6meter (2000 — 2003)
Date: 2003-09-11 03:39:01 UTC
From: M. Walton
Topic: 3474 Message: 3491

I've got a rotor in a box. Have had it for yrs. It's the whole
configuration of the mast thats going to be the challenge. Especially
getting it down and back up again. I wouldnt doubt its rusted in places
and may not collapse too easily. We'll see. I'm going to recable the
antennas while I'm at it, so got to order some LMR400.

<< I'm open to suggestions. I really dont want to spend more than $100 on the antenna if I buy one. I have a rotor. No tower. 30 ft mast with a 2m vertical on top. HF wires coming off the mast at differewnt points. I do have a 2 meter beam at about 20 ft. I dont use it at all. It is not rotatable. Anywhere you go on my property, you are surrounded by trees. >>

Well, pair up the 2m and 6m beams (50+" separation needed) and use the rotor for the stack. Get it up as high as you can and go from there. As for antennas, build a 2 ele quad, buy the Cushcraft A3S50 or the MFJ variant and use that. It will give directivity and allow you to work around some of the leaf loss. The dipole is unity gain, so the additional gain provided by the beam will help.

You're fortunate. I'm on a ridgeline, but no external antenni allowed. I did put the PAR omni up, no one (except the XYL) has said anything. Doubt a beam would be ignored

Sorry for the incomplete first post.....Blasted stupid software. AmericaOffLine...growl. Free thru the company, so I can't complain too much.

Anyway, even with the trees, a beam will allow better reception as it will concentrate the weaker signals (gain) and allow you to be heard better over a dipole. I would suggest using an omni on top of the mast (for monitoring) and good coax....RG213, LMR 400 or 9913 (get the version w/filled core...not the "heliax" style. Amazing how much water will get into the heliax style 9913! My runs are now only inside the house (attic antennas). I cheaped out on coax at first....I now pay up, buy good coax but only have to run it one time! DO SEAL CONNECTORS!! Water WILL get into all but a well-sealed connector. "N" connectors are the best, UHF (universal HF, SO239/PL259) are poor unless you use the stickem stuff to seal them.

Whichever way you go, have fun. Did have a few local openings last night, worked an area of 3-4 grids around me. Not DX but still fine and got to chat with a lot of the other 6m buffs in the area.

Enjoy!
Andrew

In a message dated 9/10/03 9:11:01 PM, cboone@... writes:

<< 've mounted verticals above horiz with only say 6 inches or so to spare...make sure the 6mtr antenna SWR doesn't change because of the 2m antenna...and you will be ok....never have dealt with the Vectronics...so cant speak on its construction or how well it performs.. $69 cant be beat unless its junk :) but I doubt it is.... >>

Chris, good point to add to my previous (cracked) post. If you're using a vertically polarized antenna above a horizontally polarized antenna, the distances can be much less (I'd recommend a couple of feet, if possible) due to the difference in polarization.

Vectronics...same as MFJ, IIRC. Cheap, bends (ask KC2SSB Andy) but seems to work. II just wish I could get my Cushcraft up and rotating. Sigh. Guess I need to convince the wife we need to move out into the countryside and put up 2-3 towers!

Cheers;
Andrew

3496. RE: [6 Meter Sked] 6 m dipole

From: M. Walton
Topic: 3474 Message: 3496

That's what I think I will do. I think I'll take down the ringo. I really have to get everything together and see how it goes. Your info does contradict some other info posted. the 50" separation. I dont think this will be a problem though. The trees are a problem here, especially this summer. I lost my sat dish sig. That has never happened before. We had a very wet spring. If I can find the time, I may give the quad a shot.

Thanks
Mark

Is seems the difference in price between the Cushcraft and Vectronics is only $30-$40. I'll go for the Cushcraft. Eham has some really good reviews on it. The 2m 11ele, will be vertical above the 6m horizontal yagi. I'm not sure which vertical I want to put up top. I might put a 5/8 2m up there for 6m & 2m. I think the ringo is 2 5/8s. I dont think that will work on 6, but I'm going to put the anylizer on it today and see how it looks.
Thanks for all the help. Now I just need to spend some money and get everything together. I am going to use LMR400. I've found a pretty good price on it.

Mark

3500. Re: Starter antennas for 6M

Yahoo group: 6meter (2000 — 2003)
Date: 2003-09-11 14:14:24 UTC
From: Tom Cox
Topic: 3500 Message: 3500

'Morning, Sixers --

Two antenna types that are good starters for 6M SSB/CW (horizontal polarization) are the PAR Electronics loops, and a "reflected M." The Par loops are available from a couple of retailers and from www.parelectronics.com. I have a pair of them, with their stacking network, side-mounted on a 120-ft tower, and I can talk to just about anyone I can hear. I know, we don't all have 120 ft of tower, but you can still get good performance at 40 or even 30 feet, if you can get the loops 13-15 feet apart, vertically.

The reflected M is a good design, and not too hard to make. There are also commercial versions available. Do a Google search for "reflected M antenna," and you will get lots of info on these physically small, but decent-performing two-element beams.

Also, if you have a 6M tuner (MFJ makes one), try loading up any wire or aluminum you have in the air... you might be surprised what a little improvising can do.

Don't neglect feedline attenuation. You can lose a lot of watts in a long-enough piece of RG-58, for example, at 50MHz. Remember, that works both ways, so lossy feedline will reduce your receiver performance, too.

Be patient. This band may be dead for weeks, and then light up like a Christmas tree for a few hours to several days straight. That's why we keep calling it The Magic Band.

"Sometimes the magic works, and sometimes it doesn't," as Old Lodge Skins said in "Little Big Man." When it works, it's gangbusters.

73,
Tom, KT9OM

Usually the top end is for FM, generally you want to be polarized
vertically for fm. 2 antennas is the key.

I know, but 2 1/2 meg antennas still leaves 3 megs of the band off limits. 8 antennas is a bit much so what can be done? a disco with a good receive amp and a lot of out put power to over come the loss will work but it too is a bit much. is there a good middle of the road? or is the 4 megs just not going to happen.

Like wise, if a 1/2 meg is the limit, then 50.125 +/- 125 and 52.525 +/- 125. is where people are lurking. then, will anybody be found out side of these limits?
Ron.

well i dont think its needed basically the 52-54 is FM the 50-50.2 is
SSB the rest is seldom used (except for a small spot around 50.250-290
for digital and 50.400 for AM)
get you a good vertical for FM and a good yagi for SSB and your all set

I'm sure you'll get lots of comments on this. For sideband/CW, you need 50.100 to 50.400 or so. Several antennas will cover that 300 kc slice. For FM work, you'll want a resonant antenna around 52.0 to 52.75 or so, but vertically polarised. A half wave vert dipole will work well for FM (and cheap), the beam can be for weak signals work on CW/SSB. Mount the vertical above the beam, use good coax for the beam and cheaper coax (RG8 or 8X will work for short runs) for the FM side (assuming repeater operation).

As an example, I've got a homebrew halo in the attic for 50.400 (driven by the AM Gonset), the PAR on top of the chimney (SSB) and the vert dipole in the other end of the attic. Not too much interaction, and I don't have to worry about switching coax. I've also got a Cushcraft A3S50 in the attic permanently pointed towards Europe on the faint hope of working "cross-pond" with an attic antenna. Sad, sad install. Ah, for a tower! Anyone need a good 3 ele Cushcraft? Makes me cry every time I've got to look at it.

One problem, Ron, is even if the antenna covered the entire 4 Megs, the polarization is different...for BEST local and NON DX distance work on SSB, you need to be Horizontal....for FM, its vertical....Most SSB and all CW is usually within 50.0-50.3 with AM at 50.4 so there is no need to have a H-polarity antenna cover more than that.
Only a special mount with say a rotor to flip a yagi from H to V pol would require the antenna cover 4 Megs...a Log Periodic could do it...

Most antennas cover 1-5 PERCENT TOPS with below 2:1 SWR....2% of 50 Mhz is 1 MHz....and that's usually on the high end...a 5% is RARE (only 5 antennas I know can do that on 6m!)...On HF, that's why a dipole cannot cover the entire 75-80 mtr band (only 500 kHz wide) while it can cover more than that of the 10mtr band (which is 1.7 MHz wide!)..it's a function of the % of the freq (3.5 or 4 Mhz vs 28 or 30 MHz)...basic b/w goes up as the freq goes up on a simple antenna.

Hope that explains it..

Typo!! for CW, you want to go down to 50.0! :)=

> For FM work, you'll want a resonant antenna around 52.0 to 52.75 or so, but vertically
> polarised. A half wave vert dipole will work well for FM (and cheap), the

For FM, CA and the rest of the 500 kHz split nuts (smirk) want you to be
able to cover from 51-53.5 MHz!! :) The 1.7 MHz split only requires
coverage from 51-52.7 MHz....much easier to do! ;)

Of course there is always the Circular Polarized antenna (which I am
running!)....Vertical and Horizontal elements fed 90degress out of
phase..works both modes but with a 3db LOSS compared to a linear mode
antenna...but saves me from having to change feedlines, etc..and I never
hear that much fading due to polarization shift..
Bandwidth is pretty good also.....reactance plays into it and I was lucky ;)

Nope. 50.090 to be technically accurate. Also, I'm talking resonate
w/xmitter, not receive. Below 50.090 you have beacons...shouldn't be transmitting
there. However, the point is well made, you DO want good receive down to 50.0
to listen for beacons.....I should have been more specific on being xmit
performance, sorry.

Ron,
You might try building this 3 element beam.....

http://www.uksmg.org/smallantenna.htm

I had make minor adjustments to the lengths of the elements,
will give you the changes if you decide to take on the project.

Robert, KC5NNS EM16

Heh....guess I should have gone with HK$ or G$ (Guyanese...only good for TP). Think Chris' prices are just a bit high....sticker shock, eh? Maybe, if Chris hasn't been run off by our (good-natured) kidding, he may indicate if he's willing to negotiate a bit on the price.

That said, the rigs are fine rigs, and the FT650 is quite the find, and VERY expensive new. However, I believe the poster will do better in checking prices, as the $1K price seemed more common about 2-3 years ago. It is still a great rig.....'bout as tough as they come. I have used several of the other rigs he advertized... the FT225RD and the FT625RD are both older, but very solid rigs. Personally, before I blew a $1K bill on a -650, I'd look around for a $300 or so 625RD. Better receiver. Almost bought one at Shelby, but just didn't have the time to dicker with the guy. He was asking $400, tho. All still have good receivers, just don't have the "bells & whistles" of the newer rigs. 'Course, I live without those....

Andrew
Kenwood TR751
Yaesu FT736R
Gonset Comm IV
Alinco DX70TH mobile
MFJ9406 for mountaintopping (K1BQT's personal rig!)
Plus a few HF rigs, some which glow in the dark.....

This weekend is the Sept VHF contest. QTH Red Rock Mtn near the
Luzerne?Sullivan Co line--elevation: 24 hundred feet!
This test marks the 24 th year
these guys are doing this ! Give them a point on the bottom 4 bands.
On six meters even if you don't have an antenna you can give a point on ssb
...
just turn your power all the way dowm and use your 80 or 40 meter dipole or
tribander. you won't blow up your radio. six meter fm 52.525
2meter FM 146.55 and 58 on the hour plus or minus starting 5pm on Sat.
223.5mc for 220 fm call. simplex
446.00 fm on 440 simplex
you work us on any band and set a sched for other bands if you have them !

Bob (N3FA)
if there are hams you don't see on the mailing list forward this to them !

3529. Drake TVI filters FS

Yahoo group: 6meter (2000 — 2003)
Date: 2003-09-14 11:58:12 UTC
From: Ken Simpson, W8EK
Topic: 3529 Message: 3529

Drake TVI filters For Sale:

Drake TV-1000-LP
Low pass filter for the transmitter
This is the filter that may also be used on the low
end of six meters, as well as HF. It is good for 1000 W
below 30 MHz, and about 200 W up to 52 MHz. It is in
very nice shape, with the copper is still nice and shiny.
$ 30

Drake TV-3300-LP Low Pass Filter
This is a modern low pass filter to go between your
transmitter and antenna, and has been optimized to
have more attenuation in the 40 MHz region, where
many TVs have their IF. It is good for 1000 Watts
"average" according to the manual, and has over
80 db attenuation at 41 MHz. SO-239 connectors
on each end. This one looks close to new, and also
has the single page "manual" with it. $ 30

Drake TV-300-HP
High Pass filter for the TV. 300 ohm twin lead.
This filter is collectable, and is unused as best I can
determine. It is still in its original box, with an "RLD"
logo on it, and says "NEW TV-300 HP High Pass Filter,
Attenuates 0-52 MHz". A grounding strap is also
attached. $ 15

Prices do not include shipping from Florida.

Thanks.

73,

Ken, W8EK

Better to use 50.6x freqs than the 53MHz freqs Propnet originalluy proposed...(and was told the same thing years ago by other 6mtr ops and coordinators...use the 50.xxx range!)...reason being the lower end of 6 opens but the MUF often does not get above 51 or 52 MHz and thus the higher FM end is not open while the lower end used primarily by SSB IS! Using FM packet on 50.62 will follow more closely the SSB band openings than the FM openings.

Monday, September 15, 2003

Dear Jim,

The family will love the down-home flavors of dinner tonight, you'll appreciate the quick preparation time! Thanks to great ideas from Campbell's® Kitchen, a delicious dinner is always just minutes away.

Tasty Tuesday Presents:

Chicken & Stuffing Skillet
from Campbell's Kitchen

Prep/Cook Time: 20 min.

Ingredients:

1 tbsp. butter OR margarine
4 boneless chicken breast halves
1 box (6 oz.) chicken flavor stuffing mix
1 can (10 3/4 oz.) Campbell's® Cream of Mushroom Soup*
1/2 cup milk
1/2 cup shredded Cheddar cheese

Directions:
HEAT butter in skillet. Add chicken and cook 12 to 15 min. or until done. Remove chicken.
PREPARE stuffing in skillet according to pkg. directions except let stand 2 min.
TOP with chicken. Mix soup and milk. Pour over chicken. Sprinkle with cheese. Cover and heat through. Serves 4.
*Also delicious with Campbell's® Cream of Celery or Cream of Chicken Soup.
Serve with a vegetable combination. For dessert serve Pepperidge Farm® cookies and ice cream.

Steam or microwave your family's favorite frozen vegetable combo to serve with this chicken dish. Prepare a plate of your favorite Pepperidge Farm® cookies to serve with ice cream for dessert.

Introducing Campbell's Tasty Tuesday Tip of the Week-exciting weekly dinner ideas your family will love. To learn more about Tasty Tuesday click here.

Avoid fruits and nuts. You are what you eat. -Jim Davis

Chris, you're absolutely right ... again.

Since I'm the one who initiated this thread, please let me be the one who tries to end it. I just wanted to voice my hopes that this e-mail list would not become like so many others have in the past -- an odorous, obnoxious pile of trash due to folks who consistently posted OT messages and corrupted the list.

Thanks for everybody's self-policing of this list. Let's make a conscious effort to remain focused and on-topic.

Now for 6M news from EL29. The weekend contest was a total bust for me. NO contacts at all. Not even any local QSOs. Maybe next time ...

One good thing came from the weekend, though! I received an autographed copy of the 3rd edition (2003) of "Six Meters: A Guide to the Magic Band" from Ken WB2AMU. Great reading!

Mmm... cold drink... good idea. All this electronics is heating up my
shack!

> Heard nothing over the weekend except worked the local Red Cross station
> on 52.525.....(but the Alinco DR-M06 they have needs to go...no NB
> in it and they could barely hear me because of line noise)

I keep hearing stuff very faintly off somewhere northwest of EL89, but
nothing solid enough to log or respond to. Grmf. Looks like it may be
Yagi time. Quad's just not cuttin' it when the band shuts down.
Yagi'll also free up some mast space for 2m and 440 beams too :-). Of
course, my not hearing squat *might* be because the FT100 is NOT, in
fact, any much better than the MFJ 9406. :-)

Well, let's grab the mic, run up 100W on 50.125, and start callin' CQ.
Never know...

There has ben a lot of talk about where to stand by to hear people. what freq. is most likely to NOT have any traffic? I am looking for a place to hang out with my son when we are not trying to make a DX contact and we don't want to bother people.
Ron

My wife and I had the same problem. We just picked a
couple different freq's and operate fm simplex. So far
,so good.

I've had one for a few months. I've always hung it fairly low to the ground (in low-hanging trees, from "upstairs" motel balconies, etc) and had ok results. Seems to be awful sensitive to whatever's around it, even the nylon rope I was hanging it from. The higher up the better, obviously, but you *will* radiate in any case. :-) I had it hanging from a 2nd floor balcony rail at the Pisgah Inn up on the Blue Ridge Pkwy, and managed a few QSOs with folks in Atlanta with 50W from my FT100. It's light, compact and fairly efficient. Good luck.

Anything other than the calling freqs:
DX 50.110
Stateside 50.125
PSK31 50.290
FM and HSMSCW 50.3
AM 50.4
Packet 50.62

I would best 50.140-160 would be a good choice....
maybe 50.150??? unless a net shows up there...(50.5 SSB may be a good spot also...
MUF may not reach that high at times....)

Some activity up to .200 here...maybe .225 or so? .250 is fairly busy on occasion (couple of nets) and .400 is AM calling freq., but, to be honest, you could use the calling freq on AM and only have an occasional interloper come by and say "hi." Lord knows Duke Power loves me for running the Gonset AM rig all the time! 'Course, now that winter is coming, the Gonset will be my "finest and warmest" rig.

Speaking of SPAM, I hope the people living in the area where the hurricane made landfall stocked up on the stuff. Tastes like dog food but never spoils - perfect for those outdoor gatherings in what used to be your dining room after you loose the roof.

Speaking of the harry-cane, this is direct from the national harry-cane center here in Miami FL.

Subject: WX4NHC Activation for Hurricane Isabel ANNOUNCEMENT

ANNOUNCEMENT September 16th, 2003

WX4NHC Activation for Hurricane Isabel

WX4NHC, the Amateur Radio Station at the National Hurricane Center in Miami
will begin operations Wednesday, September 17th at 6pm EDT (2200Z).

ATTENTION ALL HAMS ON OR WITHIN 50 MILES OF THE ATLANTIC COASTAL REGION from NC to NJ. WE NEED YOUR WEATHER DATA

...POWERFUL HURRICANE ISABEL MOVING NORTHWESTWARD...

INTERESTS FROM THE CAROLINAS NORTHWARD TO SOUTHERN NEW ENGLAND...ALONG THE COAST AND INLAND...SHOULD CLOSELY MONITOR THE PROGRESS OF ISABEL.

"...ISABEL CONTINUES AS A DANGEROUS HURRICANE..."

Isabel currently is a CAT-3 Hurricane with sustained winds of 125 MPH and though it
is forecast to weaken very slightly before directly affecting North Carolina/Virginia coast in
the next 48 to 76 hours it will remain a very strong and dangerous hurricane.

If you have weather equipment and are in the affected area please try to get that data to WX4NHC, however DO NOT put your self in danger at any time. PLEASE do not send weather that was given out by any of the media, this data is already in the "system".

WX4NHC will be monitoring the Hurricane Watch Net on 14.325 MHz.
We will also be monitoring Reflector 9210 on IRLP as well as the Echolink system
Surface Reports using our online Hurricane Report form will also be monitored.
Amateur Weather Enthusiasts with weather equipment and ON-NHC Volunteers may report directly to WX4NHC on-line at:
http://www.wx4nhc.org/WX-form1.html

These "Surface Reports" are very important as they give Hurricane
Specialists at NHC
a better idea of what is actually happening on the ground level during
the storm.

Please remember all nets will be controlled by a Net Control.

The WX4NHC Group continues to expanded its efforts to increase the
quantity and quality of
surface reports to include many different modes of reception and groups
of people;
including HF, VHF/UHF IRLP & ECHOlink, VHF & HF APRS, CWOP NOAA
Program,
CARMEN Program and ON-NHC Weather Observers Network.

WX4NHC is very proud to have maintained an active Amateur Radio Station
in the
National Hurricane Center for the past 23 years.

We appreciate all of the volunteers who help with our efforts.

See our web site for more information and details of the above programs:

FCC rules allow CW anywhere....but 50.0-50.100 is CW ONLY in the US under Part 97.....SSB is not allowed exactly on 50.100 due to technical reasons; the rules also state ALL emissions (sidebands, etc) MUST be within the appropriate subband. So operating SSB on 50.10000, you better have EXCELLENT lower sideband rejection, no carrier leakage and a damn accurate VFO!!!! :) or else you can get a pink ticket from the FCC....

Not a smart place to operate......just like operating CW on 50.0000000 or USB on 53.999...

My point is CW operators have a nice little sliver they can call their own. SSB phone operators don't have that, so why clutter up the other portions of the band with annoying dits and dahs when it's not needed?

50.0-50.08 is loaded with beacons and other signals......in the use, 50.06-50.08 is the only legal place for auto unattended beacons...below 50.06, TV and PC birdies are evident...
They DO use 50.09-50.10.......but the FCC allows US to operate CW anywhere in the entire band.....50.0-50.1 is NOT a voluntary thing.....its mandated by Part 97...

As for using 50.1000, only CW legally could operate there considering most technical capabilities of modern amateur rigs....The closest you really want to get and stay 100% legal
is 50.103 MHz....(this makes sure your LSB does not slop over the lower edge and the carrier leakage is well within the band limit as well).

Now the original statement was that 50.100 was the DX calling freq...it is not....
50.110 is the DX SSB calling freq.....some DX may use 50.100 as the CW calling freq because they may not be allowed to go below that in some countries (we need to stop think "US only" here as 6 is an international band!)

Hmm....10 kc....not much. And, to be honest, CW ops tend to be around 50.090 to 50.135 or so. Plenty of space above that.

And before someone turns this into a CW/no-CW fight, I'm a Tech class licencee. I am working on CW, and think we should encourage the use of CW (even from me, with my lousy fist, LOL!) I'd just like to hear MORE TRAFFIC on 6M, whether it is SSB, AM or CW! Haven't had a decent AM QSO on 50.400 in 2-3 months. PSK31 anyone?

Lets just get out there and operate. We, as amateur radio ops, should respect the band plan, tho. Too many people in the general public are disrespectful....why should we lower ourselves to that standard? Besides....if we use the bandplan....we know where the DX will be!

Cheers!

I believe that the FCC does not in itself mandate the band plan. If anyone ha found anything to the contrary in Part 97, please let me know.

I think that the operating with modes appropriate for each part of the band is part of the ARRL's (among other 'band plan creators') GUIDELINES.

The only FCC mandate is one of using 'good engineering practice' and not intentionally interfering with others. This is sort of like the catch all in the UCMJ -- 'conduct unbecoming ...'. Earlier this year the FCC sent notices to a number of Amateur Service operators about their use of particular modes that were outside the guidelines set forth in the ARRL's bandplan. After reviewing the regs - probably as a result of feedback from those receiving the letters, the FCC's EB withdrew the letters noting the band plans were in fact voluntary.

That said, it is still our responsibility to share the bands - and the band plans do make sense.
I don't mean this as a slam, but a recent poster's comment : "Why not? CW operators operate in the SSB phone portion of the band." seems a bit unseemly, uncivil, and not a 'good engineering practice. Two wrongs do not make a right. If you interfere with someone just because they are interfering with you, then YOU too are wrong.

Again, I said RULES, not band plan!! Here is what Part 97 says:

?97.305 Authorized emission types.
(a) An amateur station may transmit a CW emission on any frequency authorized to the control operator.
(c) A station may transmit the following emission types on the frequencies indicated, as authorized to the control operator, subject to the standards specified in ?97.307(f) of this part.

VHF:
6 m 50.1-51.0 MHz RTTY, data (5)
-do- -do- MCW, phone, image (2)
-do- 51.0-54.0 MHz RTTY, data, test (5), (8)
-do- -do- MCW, phone, image (2)

Soooooo under PART 97, CW is allowed on ANY FREQ your license class allows....ANY phone on 6 is
only allowed ABOVE 50.1! This is NOT a bandplan but FCC RULES.

Also this requirement counts:
?97.307 Emission standards.
(b) Emissions resulting from modulation must be confined to the band or segment available to the control operator. Emissions outside the necessary bandwidth must not cause splatter or keyclick interference to operations on adjacent frequencies.

SO SSB exactly on 50.10000000000000 is NOT legal....
However you are correct on the good engineering practice....

?97.101 General standards.
(a) In all respects not specifically covered by FCC Rules each amateur station must be operated in accordance with good engineering and good amateur practice.

I started to post a long explanation of FCC rules (we all have a copy and have read Part 97 ... right). But I see WB5ITT has beat me to it. It's the rules people not a bandplan.

Actually when ragchewing I like to stay pretty close to 50.125, say 50.130, 50.135, 50.140 etc. Seems that when an opening pops up most hams tune up to maybe 50.150 looking for sigs but not much further. I can't seem to be comfortable with odd freqs such as 50.127 etc. I actually have a semi local station who likes to talk on 50.126 and he wipes me out everytime. I don't know how it is where you all live but in OK there is plenty of room on 6 meters to find a spot to talk.

Doug,
as you said below, most people don't go above 50.150.....which is why 50.200 was doomed as a suggested calling freq (it was proposed to be a match for the 2mtr 144.200 calling freq)....but the main issue there is the MUF sometimes doesn't get to 50.2 (as most old time 6mtr ops know)....so 50.125 has remained the stateside calling freq....

Here in Texas, there is plenty of b/w as well....I usually monitor 125 at home... but move up or down if the band opens...

(Part 97?? READ????!! You mean I have to read something else besides the answers for the test? ;)

Hi, New member and new ham kind of stumbling along right now, I know this group will be a big help to me,sems to be a lot of good people hear. My station consists of an Icom551D, power suply, Mfj 300 watt tuner, Deep cycle battery, high tec batt. charger, and a half ass antenna (ham stik in a tree). I mainly operate with the battery. Any one have experience with this rig ?

73's,
Dick, kc8vfe

551 is a decent rig....does yours have the optional FM module?
IIRC, it does not have all mode squelch (which is a bummer!)...
I think the 551D is the 100watter (used to operate the low power version)...for best SSB use, put up a horizontal antenna....
that's the polarization for "local"/non skip SSB work...when the band opens, anything goes but the times its not open, you'll appreciate a good antenna! :)
A round halo, square halo (also called a squalo), turnstyle or cross dipoles, etc would be a good choice. Plenty of sites on the web with info.....
Welcome to 6 Dick....it can be a lot of fun when the band is good...and lonely when its not :(

Hi Cris,
Actually I have 2 551D's I bought the 2 ed on for the fm board. Yea 100 watt. I know i need abetter antenna instalation. I know about (every thin goes), AT first when I was trying to tune the antenna (it was about 8 feet off the ground), I heard a cq from Belgum, I was afrait to answer I did'nt want to hurt my radio. Wher you located ?
Thanks & 73's

Well, there ARE a couple of us out there <<grin>>, but I will use the Alinco on AM on occasion, too! Seriously, tho, there is a net in the NC/VA area, Wednesday pm IIRC, and I've had the occasional ragchew with folks who have just decided to try calling on AM. When I'm in the shack, the 6m rig tends to be on, and I give an occasional CQ (during breaks, while working on gear...my therapy!!) to see if I can rouse anyone out there.

Wanna set up a sked? Like most folks, it tends to be early AM or late PM before I get to the shack.

Subject: Re: [6 Meter Sked] Where to stand buy?

50.0-50.08 is loaded with beacons and other signals......in the use, 50.06-50.08 is the only legal place for auto unattended beacons...below 50.06, TV and PC birdies are evident...
They DO use 50.09-50.10.......but the FCC allows US to operate CW anywhere in the entire band.....50.0-50.1 is NOT a voluntary thing.....its mandated by Part 97...

As for using 50.1000, only CW legally could operate there considering most technical capabilities of modern amateur rigs....The closest you really want to get and stay 100% legal
is 50.103 MHz....(this makes sure your LSB does not slop over the lower edge and the carrier leakage is well within the band limit as well).

Now the original statement was that 50.100 was the DX calling freq...it is not....
50.110 is the DX SSB calling freq.....some DX may use 50.100 as the CW calling freq because they may not be allowed to go below that in some countries (we need to stop think "US only" here as 6 is an international band!)

Have an acquaintance (N1FQQ) looking for a (NPN)
AQ1L2Q transistor.
Anyone have any sources?

Thanks.

3592. Question OT...

Yahoo group: 6meter (2000 — 2003)
Date: 2003-09-22 01:37:40 UTC
From: K. Wise
Topic: 3592 Message: 3592

My wife told me that my hobby needs to self funding. Soo I need to get rid
of some of my stuff at the swap at our Hamvention in October. What I would
like to know is what 2 Motorola HT-600's w/drop-in chargers could be worth?

They do work and I'm told they can be programmed to work on 2mtrs.
Right now they are on 151mhz..

Help me out here I need to raise cash for a Icom 706 MIIG

Thanx

why dont you sell them on ebay you would make more money that way that commerical stuff sells well on ebay
hams tend to over look that stuff cause most dont want to hassle with converting it to the ham bands
good luck

BTW tell the wife that your hobby is self funding you could be out at strip clubs shoving $1 down the Gstring of some pole dancer but no your home with her and your radios so your saving $50-200 a month this way ....grin

3599. Greetings From New Member

Yahoo group: 6meter (2000 — 2003)
Date: 2003-09-23 00:45:35 UTC
From: kent ross
Topic: 3599 Message: 3599

Hi All, I just found this site, I'm fairly new to 6 meters,I've been liscensed as VE9KAR since Feb/02, and on HF since March/03, I really just started to work 6 meters in July and August this year. I worked 77 grids, and 3 DX countries in July and August (Greenland, France, Bermuda) My station consists of a Alinco DX70TH putting 100 watts into a MFJ 1798 multiband vertical that I optimised for 50mhz. Seems to work OK, I recently bought a 48' tower that I hope to have up before cold weather hits, I'm rebuilding a 4 element 11 Meter beam for 6 meters, and this should sure help.I was hooked on 6 meters on July 4th, my first big opening, I started calling cq, and had a moderate pile up going for almost an hour, GREAT FUN. My grid is FN65pv, and I hope to work some of you on 6 meters.

From: Barry_bogart
Topic: 3602 Message: 3602

When I saw your call, I was thinking Yukon! How can he do that from there?! I have worked all corners of the US from VE7 on 10w, but no one so far East of British Columbia, so you can understand my confusion.

Anyway that is an excellent start. Too bad you missed June. Not to mention the last two years. But Six can work any time, you just have to be (real) patient. And persistent! Welcome to Six. Its addictive.

TtEXAS qso PARTY 9/27 - 9/28

I WILL GOING DOWN TO BE ON K5CWR TEAM

I HAVE 6 METER IS IT WORTH TRYING 6 METERS MOBILE WHILE DURING THE CONTEST

I AM GAME BUT NEED SOME ANSWERS FAST ON WHETER TO TAKE THE ANTENNA.

IF A POSITIVE RESPONSE WHAT FREQ WOULD BE GOOD? I CUD WORK CW / SSB & FM
Will be running a IC-706 with a tuner

NEED A RESPONSE BACK FAST

ANY SUGGESTIONS ??

BELOW IS INFO

The Texas QSO Party is SCHEDULED TO START ON THE LAST SATURDAY IN SEPTEMBER. Operating times will be from 1400Z on SATURDAY to 0200Z on SUNDAY and from 1400Z to 2000Z on SUNDAY.

For those of you who are County Hunters, contestors, or like to have fun, this is a way to get that rare or needed Texas County in the western part of the state.

.
We would appreciate you helping us in our Multi-OP Mobile Operation !!. Simply put we need your QSO. Please lend a hand and give a contact on 20 or 40 meters CW or SSB. This will a

fantastic run of Western Texas counties. For County Hunters working on awards Please remember Fred has 5 Stars for County Hunter Awards.

Message from K5CWR (Fred) follows:
Subject: Texas QSO Party (TQP)
Call: K5CWR
Date of Post: 09/14/03

Message: I am offering top three certificates cw and ssb for those contacting me during the contest. See http://www.txqp.org/ and check out KJ4EJ TQP logging program. I plan to run about 50 counties, will be multi-op, two contest stations on 20 and 40. We hope to help as many folks as possible and will appreciate any contact you can give us. We hope to help as many folks as possible and will appreciate any contact you can give us. Of course, everyone is 59(9) county (four letter ID), and all we need is a 59(9) and your state, province, DX country, or TX county. Join us--hope we clear some of your needs.

Again the Exchange will be:
Non Texas stations use RS/T, State, Country, Canadian Province, or maritime region.

Texas stations use RS/T and Texas County using the TQP 4 Letter Abbreviations.

Counties that will be run include the following over the two day event:

Saturday - Sterling, Glasscock, Howard, Martin, Midland, Ector, Andrews, Dawson, Gaines, Terry, Yoakum, Cochran, Hockley, Lamb, Bailey, Parmer, Castro, Swisher, Hale, Floyd, Crosby, Lubbock, Lynn, Garza, Borden, Scurry, Fisher, Kent, Fisher, Jones, Haskell, Taylor, Callahan, Shackleford.

SUNDAY: Coleman, Eastland, Brown, Comanche, Mills, Comanche, Mills, Hamilton, Coryell, Lampasas, San Saba, Llano, Gillespie, Kerr, Kendall, Bandera, Medina, and (rare) Bexar

I'm on 6M over the weekends....prop. may be a bit low, but we're facing a SW sloping front which may cause some propagation towards TX. Try 50.95 to .100 for CW, 50.125-135 for SSB and 52.525 for FM.

We'll be listening and calling.

Hi group
I'm look for info on how good or bad a 6meter m2 sq loop antenna works
when its on a tower and any tips on using it
on 6meter ssb tnx n9mfk

[Scot Clayton] I've had one for years, and it's a fantastic antenna!

3610. Home Brew Beams??

Yahoo group: 6meter (2000 — 2003)
Date: 2003-09-29 02:50:03 UTC
From: Kent VE9KAR
Topic: 3610 Message: 3610

How many of you are using home brew beams? I just built a new beam this weekend, its a 5 elements on a 16 foot boom, with a gamma match, its my first antenna project,(I choped up and re built an old 11m beam that was on my used tower when I bought it) computer model predicts 10.77 dbi gain, and 31.15 db f to b Ratio, I tested it this afternoon and seems to be A1 as built, SWR is pretty much flat from 50 mhz to about 50.5, and under 2:1 from 50 to 50.8 mhz, and didn't need any adjustments!! should be much better than the vertical I've been using, I tested the vert against the beam(sitting on sawhorses in my driveway) and a local ham said the beam was 4 s units better than the vertical. Can't wait to get it on the new tower (it will be up about 54') another project I hope to have done before cold weather sets in. can't wait to try it on the next opening

Kent,

I am still researching which antenna I want to build. I'm running a dipole and it is not cutting it. I will probably start a little smaller. A 3ele Yagi looks to fit what I am looking for. Now all I need is some time.

I wonder how much of that was the gain and how much was simply the horizontal polarization. What was the other ham using?

Topic: 3613 Message: 3614

Greg,

I've had my 5054DX for about 2 years now. It's very similar in operation to my 10M mobile radio (Uniden HR-2600). I've never had any problems with using it, either mobile or portable.

When the band will allow me to make contacts, I've received solid 59's from the hams at the other end. However, I've not made many contacts on the band.

You might want to visit the following websites to read the reviews of the radio:

Ranger-USA Website
http://www.rangerusa.com/6meter.html

eHam Website
http://www.eham.net/reviews/detail/1597

San Diego Six-Shooters Website
http://n6six.50megs.com/custom2.html

Hope this helps!

the other station was using a wire dipole, and yes I'm sure some of
the differance was the cross polorization,However I'm quite anxious
to get it on the air during a proper 6m opening.I hope it works well!!

well good news is you have all winter to work on it then in the spring
when it warms up you can get it in the air just in time for the Eskip season
good luck

Around the winter equinox there tends to be some activity...I had a great December last year...worked several SA stations, several CA and Caribbean stations. Heard an Argentine station, but didn't have the oomph to cut thru the oh, say, 500 other guys wanting to work him. Oh, for outside antennas!!!!!

oops sent a blank email. i would like to know the difference of 11 metors and
6 meters on skip. is it about the same when the propagation comes in? you
people say that when 6 skip comes in you can work the world. well does anyone
know how rommel was defeated in africa? it was in part of an east coast ham
operator in world war 2 listening to 11 metors this ham operator in massachutes
heard foreign language on 11 metors. he told the war dept. they set up a
monitoring place. seems the skip was very high that year i think the top of the 11
year skip cycle. anyways rommel used cb frequincies to talk to his tanks.
everytime rommel gave out info the war dept intercepted it and used it against him.
that didn't win the war but helped. so you see 11 metors can really skip too.
don

11 meters is closer to 10 meters than it is to 6 meters
and if you can work the world on 10 why couldnt you on 11
6 is suggest to nearly every type of propagation their is its as
affected by terrestral weather as it is solar weather
thats why its called the magic band cause it pretty much does as it wishes

3622. Re: [6 Meter Sked] KG4PJT Ranger 5054?

Yahoo group: 6meter (2000 — 2003)
Date: 2003-09-29 20:08:15 UTC
From: Doug Huchteman
Topic: 3613 Message: 3622

Hi Greg. I really like the Ranger 5054DX. I used one this summer E season with good results (42 states worked, 94 grids confirmed, several other countries) using first a Par OA50 loop and then a small 3 element yagi. Being a 25 watt radio you may give up one or two S units as compared to a 100 watt radio and I often wish I'd bought the 5054DX100. Looking at my logs I've noticed that most of my signal reports were S7 and not S 9. Late in the season I upgraded to an Icom 706MKIIg and using the same antenna my reports were consistently S 9 with it. Since the Ranger goes for about $250 and the Icom for about $750 I think it's a great deal and makes the Ranger a great way to get into 6 meters SSB for not a lot of money. BUT if you want to work 6 meters FM be aware that it only puts out 10 watts in that mode and you have to add a tone board to work repeaters. Good luck and hope to work you on 6.

I hope the 5054 is cleaner than the 2950 I previously owned.
It was impossible to use it near other rigs.
A couple of years ago I attempted to use my 2950 at our club's field day and
it interferred with all the other rigs inuse that I had to shut down my rig.
Antennas,cabeling,etc. were all inspected and it was determined by our club's
engineer to be the 2950.
I have since gotten rid of it and replaced it with my FT-100D.

From: ve7baq
Topic: 3628 Message: 3628

I have been interested in six meters for quite a long time but have not been able to get on until lately. I am in the process of putting up a vertical antenna (six meter Cushcraft AR6 Ringo). I have heard many things about them, (very good, very bad, so so, etc.), depending on whoever I talked to. Anyway the price was right! The reason for this post is to post a question. As the six meter band covers quite a large spectrum, what should be the best portion to listen on for any signals? I live in Prince Rupert, BC, Canada, right on the west coast up near where BC joins Alaska. About 50 or so miles from Ketchikan. There is no six meter activity here, most of the hams either work IRLP or two meter repeaters, or HF. I realize that there are no real ways of knowing when a signal will come this way but if I had an idea of the most used frequencies I just might be able to snag one. Will be using a FT-100D at about 100 SSB watts if I hear someone. I'll be listening, Einar, VE7BAQ

You need a horizontal antenna for good "local" 6m SSB work...verticals work on FM ok or SSB during a band opening but when the band is not opened, you want to be on the same place as everyone else for best
results.

A Cushcraft Ringo is ok for 6FM work..for SSB work, I would suggest a halfwave or fullwave length Halo
or similar...a PAR 6mtr loop is great for use on SSB and easy to put up....for best results,
put up both antennas and tune each for the correct range (vertical on FM part and PAR on SSB)..
and be ready for 6m fun....

50.125 is NA SSB calling freq....50.110 is used for DX calling freq.
50.4 is AM calling freq...52.525 is FM simplex calling freq.
50.04-50.08 is best place to listen for CW beacons...

Welcome to 6!

Einar, welcome to the group. Actually, there are several Alaska active hams
on 6M, would have to dig up the calls, but I had several 6M QSOs while in the
area of Ketchikan & Juneau during a cruise in May, several on sideband. My CW
skills are still rather poor, but did manage one CW QSO. Monitor 50.125 and
50.110, you'll be popular when the band opens! The Ringo is OK...but you
will do better with a horizontally polarized beam. We'll be listening for you!

to work SSB, you need to use a horiz antenna...I have
experience with dual ham sticks in a diapole
arrangement......for the cost of about 60$ US. good
luck.

3635. TenTec Hamfest this weekend

Yahoo group: 6meter (2000 — 2003)
Date: 2003-10-02 12:58:29 UTC
From: Bruce H. McIntosh
Topic: 3635 Message: 3635

I'll be heading up from North Florida on Friday to the TenTec hamfest in Sevierville, TN, and I plan to have the FT-100 with me, trying for some mobile QSOs on 50.125, 50.150 and/or 50.525FM. Don't know precisely what time I'll be where, but I'd love to add a couple mobile entries to the ol' logbook! :-)

On the way up I'll likely be on the 2m 5/8, which works just fine as a 1/4 for 6. Coming back, I hope to have acquired a stout mobile mount for my now-a-building "$20 Martian Death Ray" (seriously, search for "Martian Death Ray" on the ARRL website) bugcatcher.

That reminds me... gotta go run some new 12V lines from the battery into the front of the station wagon for the FT-100! :-)

(*SIGH*) Brain got behind fingers there. 52.525 FM. Yes. Quite. :-)

Heck, the audio's nothing to write home about, but the FT-100'll do AM
too. Any takers for 50.400? :-)

I hope you have the AM filter! I've heard without it, AM is a lost cause on the FT-100D. I recently bought a second FT-100D for use in the car and it just happened to have the AM filter installed. I have since moved that radio into the house and sold the one that was in the house. I haven't made any AM contacts yet, though.

I don't know if you will be coming anywhere near
Augusta,GA but if you do try the 145.490 repeater. It
is the one most used in this area. We also have a 6m
repeater in the area but no one uses it, so 6m in this
area is pot luck! Have a safe trip.

Hi all,

I've been lurking here for quite some time. Noticed everyone is quite friendly.

Just wanted to say Hi and to start letting people know I finally got around to rebuilding my ham radio website.

All I have setup is the forum and everyone is free to use it. No popups/banners/etc.

I setup and installed the forum software myself, but I didn't write the software.

Let me do some digging and I'll see if I can find some info that may help you get your webpage setup.

From: Christopher Boone
Topic: 3644 Message: 3645

If it is not a rptr, then
1) Why does it ID as such? (call/R)
2) why does it ID every 10-15 mins with NOONE using it (illegal under Part 97)
3) why does it give out the time every 15 mins on 52.525 (also illegal under Part 97)

I have operated remote bases for years myself...I know what they are and what the rules allow, etc. What he is doing is causing interference on 52.525 SIMPLEX.....regardless of whether its a rptr or not.
(Yes it SHOULD ID, but only when someone is using it...)

I have worked a few folks here in NE OH with me on 52.525 and found that they were on 146.520 2 meters (or on 440 once). They said they were working through a cross band "trans-peater" or something like that. Interesting, if not useful.

From: Christopher Boone
Topic: 3644 Message: 3647

It is called a crossband rptr or remote base depending on the band THEY
are on....(remote bases cannot be legally controlled from 2mtrs...only
222.15 and above since that involves AUX operation and control of a
remotely controlled station)....if the crossband system is within the
Part 97 rptr subband on the output band in question, it CAN be
classified as a crossband rptr...but then a crossband rptr on 29.6 or
52.525 IDing every 15 mins and telling the time is NOT good engineering
practice and IS malicious interference...and thus illegal under Part
97...If the CW ID ran only when the system is in use, thats one thing...
IDing every 15 mins and speaking the time with NOONE keying it up
is another!!!! Its just NOT good amateur practice period! (hello? Common
sense here!)

But a inband rptr on 6 with an output on 52.525 is not a good idea
either..and leaving a crossband system TRANSMITTER on when noone is
using it is not a good idea either....
We have too many lids on the bands already...we dont need to add to the
idiocy!

Maybe I'm misunderstanding here, but every repeater that I have ever used has ID'ed itself without anyone using it and frequently repeaters give the time, although it's probably about once an hour. After a period of no activity, the local repeater I use the most ID's itself with it's call when noone is transmitting and even says phrases like "Ocean County's #1 repeater". I was under the impression that a repeater was required to ID itself every 10 minutes, just like a ham, even if it isn't in use.

3649. Re: [6 Meter Sked] New Repeater ?

Topic: 3644 Message: 3649

This needs to be moved to the repeater builders list (repeater-Builder@yahoogroups.com), but my thoughts are;
The repeater may do a "clean up " ID 10 minutes after it previously IDed, even though there is no current activity, that is required and OK.
If it IDs every 10 minutes, it is a "beacon" and is subject to those rules.
If it IDs with the time every "when ever" (like every hour with a clock) that is a beacon too because "time" is not sufficient to meet the "info for Ham use" "broadcasting" rule,,,, (as a code practice would be.....)
If anyone puts a "remote base" on 52.525, it should be only retransmitting users transmissions and necessary IDs, and not the repeaters "other info" that is normally acceptable with "full duplex" use.....
Keith WE6R, Monterey.
My webpage; Six Meter Repeater list and some interesting links for Monterey and California;

Over 4900 coments as of October 4th, 2003---WE NEED TO DO THIS! ALL OPERATORS SHOULD ENTER THEIR COMMENTS AND PASS THIS ONTO YOUR E MAL REFLECTORS/LISTS!
Lets get it over 100,000 comments quickly!

I am against the use of exposed or open line BPL. BPL poses a serious problem for any user of the HF Spectrum. This would include Amateur Radio Operators, Short Wave Listeners, Military and Transportation services. BPL drowns out many AM broadcast stations on the 550 Khz. to 1700 Khz. frequencies. The broadcasters will complain that they are not able to reach the current market with their advertising and programming.

For example, in Emmaus, PA, where BPL has been already been placed into service. Many listeners in Emmaus cannot hear KYW AM 1030 kcs. in Philadelphia, running 50,000 watts power. BPL also renders the HF spectrum useless to Amateur Radio Operators within 100 meters of the exposed BPL lines.

Currently Cable Services deliver similar services via "Closed Circuit" cables and fiber optics. Leakage of the Cable Services into the HF spectrum are severely dealt with by the FCC. Leakage if BPL into the HF spectrum will not even be a violation as open wire cannot suppress leaking of RF. If BPL is permitted, it should be only on shielded and filtered lines, similar to those required by the cable TV industry. RF signals are not supposed to escape from or intrude into the cable TV lines. Radio signals can coexist with cable signals even on the same frequencies. Havoc occurs when signals leak into and out of the cables. Are the BPL users going to establich replacements for the current amateur radio emergency communications stations?

Currently, we hams frequently contend with noisy electric power lines, hardware, and transformers which interfere with our reception. The FCC requires the electric utilities to repair and clean up those lines. Our local electric utilities, Met Ed and PPL, are very cooperative, compliant, and helpful. Please do not allow any change by allowing "open wire BPL." During emergencies, how will we communicate?

Even if BPL is turned off during emergencies, what hams will be left to communicate? They will have quit in disgust, sold their equipment, and dismantled their stations. The FCC must protect the non commercial communications interests that invade the HF spectrum. To damage the HF infrastructure of over 1 million licensed amateur radio operators, is to remove the backbone of emergency communications.

There are better ways to accomplish the same goal that the power industry is seeking. Lets build covered bridges around the problem, not clear the village

of all the infrastructure.

No, repeaters DONOT ID every 10mins even if noone is using it..

The current rules state (and I will not quote the ENTIRE part but only relevant):
97.119 Station identification.
(a) Each amateur station, except a space station or telecommand station, must transmit its assigned call sign on its transmitting channel at the end of each communication, and at least every ten minutes during a communication, for the purpose of clearly making the source of the transmissions from the station known to those receiving the transmissions. No station may transmit unidentified communications or signals, or transmit as the station call sign, any call sign not authorized to the station.

(At least every 10 minutes DURING communication....this applies to all amateur stations.....including repeaters...now if there is noone keying it up the rptr, it then is a CW beacon....automatically controlled beacons are NOT allowed outside 50.06 to 50.08 on 6mtrs; yes the FCC has warned folks in the past about beaconing with a rptr IDer...its not in the rules but the FCC interpreted it that way...Just like reverse autopatches that are not answered OFFair and screened 1st by a control operator is illegal..but you wont find that exact statement in the rules)

(b) The call sign must be transmitted with an emission authorized for the transmitting channel in one of the following ways:
(1) By a CW emission. When keyed by an automatic device used only for identification, the speed must not exceed 20 words per minute;

(hmmm his IDer is running about 35.....guess someone really needs to read the rules)

Now here is another part that is relevant:
?97.101 General standards.
(a) In all respects not specifically covered by FCC Rules each amateur station must be operated in accordance with good engineering and good amateur practice.
AND
(d) No amateur operator shall willfully or maliciously interfere with or cause interference to any radio communication or signal.

NOW common sense and good engineering practice should tell you, IF NOONE is using the rptr, WHY have it ID? Also running an output on 52.525 SIMPLEX and having it ID EVERY 10mins with NO user keyups....THAT is intentional interference....say I did this on 146.52 OR 29.6 simplex? (think I would live thru that? :) Does that make sense? NOPE...& it sure

doesnt on 52.525!

Nope...its a crossband from his uncoordinated 146.80 rptr.....but the 6mtr side has IDs every 10 mins, time announcements in-between that and makes 52.525 useless to monitor!!! BUT the ID should NOT be keying the 6mtr xmtr...which also has squelch tail (Hangtime)....damn, doesnt he read Part 97 and use his brain?

I have built/operated remote bases for DECADES..remote base XMTRs should NOT ID unless they are keyed by a user from the other band....this is not the case...it IDs EVERY 10mins....period!

Anyone who does this is a LID.....like the idiots who leave their 2mtr to 29.6 xband links on when intermod is present on the 2mtr side...and it repeats out on 10m making the channel totally UNusable.

Now a good xband link done properly, I have NO problems with.....pity
that some folks cannot use common sense on the,...
Riley must have found something improper in his operation...otherwise,
a properly run xband link as such is a good thing......
I ran a 440 to 10mtr SSB remote back in the 80s (using my RC850 and a
converted CB!! Had freq selection on it..including RIT using the rotor
control off the 850 thru a D->A convertor to shift +/-5 kHz..)
I also have run a 220 rptr (its here at the house) with a HF & 6mtr
allmode rptr base (using my ACC Shackmaster 100 and TS680)....
now working DX with a 220 or 440 HT is fun!! working 6 when the band is
open thru a rmt allows folks in TV2 areas to avoid TVI at home (and we
all know how important that is!!! ;)

But NO rptr output should be on 52.525.....especially an IN BAND rptr on
6... xband rptrs should not be placed there either....simplex links
(with NO squelch tail and the rcv hears as good as the XMTR talks) is
ok....but many of them have 100+ xmtrs but rcvr NOISE up the
ying-yang....which makes them alligators...(and we all hate that! ;)

Common sense seems to go out the window when Ego is involved..

And where's the FCC's definition of an "amateur station"? Surely a
repeater isn't considered an "amateur station".

Like I said, every repeater that I have spent any time listening to has ALWAYS ID'ed itself in intervals and transmitted information about the repeater. Do you use any repeaters yourself?

Also, by what you've been saying about ID'ing only when in communications with another station, it would seem to infer that I can't give my callsign on a repeater unless I am going to have a QSO with someone else. If it's 4am and no on is on the repeater, are you saying I can't say my callsign every few minutes because I'm not in communications with another station?

Sorry, Andy, but he is right. A repeater should not come on the air by itself and do anything--give the ID or time. Perhaps someone is "kerchunking" these machines that you hear, and they are not ID'ing, but it causes the repeater to do so within the ten minute time frame.
And yes, if you are keying up the repeater for the sole purpose of giving out your callsign for no reason, you are not operating legally, either. Most people who come on and just give a callsign are either testing, or want to announce that they are monitoring in case someone wants to chat.

And yes, some machines do come on hourly with the time and a promotional announcement, and it is not legal if they do it with no one keying them.

Found it on my own:

"5) Amateur station. A station in an amateur radio service
consisting of the apparatus necessary for carrying on
radiocommunications."

I guess that means a repeater is an "amateur station"

But here's some other interesting information for the topic at hand from
Sec. 97.205 Repeater station:

"(b) A repeater may receive and retransmit only on the 10 m and
shorter wavelength frequency bands except the 28.0-29.5 MHz, 50.0-51.0
MHz, 144.0-144.5 MHz, 145.5-146.0 MHz, 222.00-222.15 MHz, 431.0-433.0
Mhz, and 435.0-438.0 Mhz segments."

You'll note that on 6m, the rules only seem to exclude 50 - 51 mhz for
repeater operation. So, we go back to the old "voluntary bandplan" where
52.525 is the "agreed upon" calling frequency, but it's apparently not
bound by law. Of course, if it's an uncoordinated repeater, and there's
any problems with it, the control operator will of course be responsible.

Has anyone thought to bother Riley with this?

If I give my callsign on a repeater, it's not just to hear the neat
"courtesy tone", it's to announce I'm on the air and monitoring,
although all I give is my call, I don't go saying "KC2SSB, monitoring",
etc... If what you're saying is true, then there must be lots of illegal
repeaters out there. Everyone one I've ever spent any time listening to
ID's itself without anyone keying it.

I do. I've been using repeaters for 30 years. Also monitor/scan about 40 on 2m/220/440 all day. I have NEVER heard any repeater ID if it had not been in used for over 10 minutes. You must remember someone doing a fast "kerchunk" makes it consider itself as active during that ten minutes, which may be what you have heard.

I hear some ID with time, temperature, and even a description of the repeater or announcement of who owns it, etc. but never more than once every half hour and even then only if it is busy or has been "kerchunked". There are a few in the area that give reminder announcements of upcoming events, such as "The XYZ Net begins on this frequency in X minutes", but these are things announced at the appropriate times and not just spaced out at repeated times on an inactive repeater.

If any of the local repeater owners were to begin ID'ing every 10 minutes when inactive, as you have described, the local users would very quickly let them know that whether legal or not, it is very poor operating procedure.

Yes, there are lots of repeaters out there that do not operate totally
legally, several in my area.
But don't forget that, if a QSO was in progress and the repeater ID'ed
itself near the end of the QSO, it could possibly wait almost ten minutes
afterward and ID itself again, and do the announcement, and be legal.

NO! I just found my stick and want to get my licks in :>)

Our first repeater back in 1977 would ID every ten minutes. 24 hours a day.
7 days a week. It'd drive you batty. You couldn't set it to ID on usage.

Maybe some systems are still using some of these older controllers.
We've came a long way in the last 25 years.

Yes, they are...you think repeaters are different?? ALL stations operated under Part 97 are amateur stations. Some are operated as repeaters, some as auxillary (telecommand in the current rules), some space stations, etc...but the ID rules apply to all amateur stations as noted below...with SOME exceptions as also noted (packet stations usually ID with every transmission since its call is usually in the brackets...but they too have to ID once every 10mins of use if the call doesnt show in the header; they do NOT have to ID in CW as they were required before the rewrite in 1989....ATV stations can ID with video only....same as commercial TV)

Look in Part 97.3 for definitions:
(5) Amateur station. A station in an amateur radio service consisting of the apparatus necessary for carrying on radiocommunications.

Andy,
I have been a rptr owner/operater/user since 1974.....and have served on the Board of Directors of two state coordination groups (I was Part 97 consultant for the Louisiana Council of ARCs in a lawsuit brought against it; I think I know the rules...besides, it's all there in Part 97..you just have to read it ALL, not just parts or skip over things).

Most repeaters that ID and the last time someone was on it is more than 10 mins are in violation of Part 97 because they now are in beacon mode...and automatic beacons are only allowed in certain subbands on bands up to 430..remember, just because they CAN do it, doesnt make it legal..

When calling another station OR making a CQ or just IDing to see if anyone else is around, you still have to ID....either when you 1st key up OR later at 10mins...so that is legal...also you MANUALLY key it up..not by auto means...(manual beacons can operate anywhere as long as a control op MONITORs and make sure NO interference occurs...not the case here..his IDs and Time annoucement on 52.525 causes interference to legit simplex users there)

NOW you can join a QSO without giving your callsign...until the 10mins is up...that is legal btw.....(a lot of folks dont realize the rules allow that now...under the OLD rules, you HAD to give your call at the beginning and end of communications or series of transmissions but that was changed in 1989..

Have to disagree on the above statement here, Paul....when you key up
and ID on the rptr, you are perfectly legal..you are IDing to see if
anyone is on the freq...but its a MANUAL ID under control op control
(YOU!), not an auto ID by a timer......if you manually key your station
and ID, you are expecting a reply (unless you are a jammer! :)= Now
when the rptr controller does it by itself, it is doing it
automatically..and thats not allowed except for automatically controlled
beacons...IF the control op is monitoring the rptr, the beacon ID can be
legally used but only under that condition...to make sure NO
interference happens (and isnt that the big issue?)

> Most people who come on and just give a callsign are either testing, or
> want to announce that they are monitoring in case someone wants to chat.

You bet! :)

The old rules only required ID at the beginning of the rptr use (rptrs
had different ID rules under Part97 back in 1977 vs normal stations :)

Yes, it has been beat enough...and I think we settled the issue...
I havent had a chance to listen to 52.525 today....had my antennas
disconnected due to thunderstorms last night...
May get on 6 later tonight and see....

BTW Dave, making a rptr ID only during usage is very easy....ANY old CW
ID timed by a 555 timer would do that....heck, my 1st rptr in 1974 at
the age of 14 had a CW ID that waited for the user to UNkey and then
IDed...but if no user, no ID :)

Yeah we have come a long way...in 30years.....
But 6 is still fun!! :)

Chris

Chris,
No, you really didn't disagree. Later in my message I stated that if you were sending out your callsign to let folks know you were on frequency and monitoring, you are legal...so we do agree.
My statement referred to Andy's message, which mentioned sending you callsign for no reason at all...meaning that, even if someone answered you, you did not want to talk, and you were not conducting a test.
Note that I have never heard anyone do that! (It would be like intentionally transmitting with the volume turned down.) But if anyone did, it would be illegal one-way communications, if it served no legitmate purpose.
And, of course, you are also correct about the "automatic" part of it.
73,
Paul K4PDM

3675. TN-FL trip on Monday - a whole lot of nothing

Yahoo group: 6meter (2000 — 2003)
Date: 2003-10-07 11:04:03 UTC
From: Bruce H. McIntosh
Topic: 3675 Message: 3675

I just drove back Sunday from the TenTec hamfest in TN to my home in FL. I'd finished up my "$20 Martian Death Ray" bugcatcher and had it tuned for 6m and hooked up to the FT-100. I called CQ on 50.125 just about every 5 to 10 minutes for the entire length of the 10 hour trip, and never heard a peep in response. I figure there were three possible explanations:

1) I buggered up the antenna and it wasn't radiating despite the radio's meter indicating 75W out and low SWR. I'm disinclined to go with this explanation, since during the process of tuning, the meter would indicate low-or-no output power and VERY high SWR; once I got it set up right, the SWR dropped to below 1.5:1 and output power went over 50W.

2) I got the antenna right, but the FT-100's receiver was either the fritz or just simply not up to the task, meaning someone tried to respond and I just didn't hear. I'm also disinclined to go with this one, since on the way up I had my 2m 5/8 hooked to the FT-100 and was able to make one SSB and one FM contact, and heard a couple other folks on SSB that I was unable to contact.

3) I got the antenna right, but the band was deadDeadDEAD and nobody was local to where along the highway I was and actually listening when I went by.

If you're going to use one of those Par loops, a rotator really won't be
needed. It's my understanding that those antennas are omni-directional.

How many times have you sat down and called CQ CQ CQ ...
and got nothing, and that was with a good antenna.
They have a 6M FM repeater in Midland TX (30mi)
and I can't hit it with 10 W and a gain vertical.
If it is any consolation, 10M has been equally bad.

The loop is omni directional and can be stacked for 3db omni gain....From their web site at http://www.rf-filters.com/omnis.htm:
"The Omniangles use an electrical length that is longer than a half wave. Combining this electrical length with the isosceles triangle shape results in a pattern that is within 0.5dB of being a perfect omni. Additional benefits are wider bandwidth and less rain detuning than traditional loops and slightly more gain- about 0.5dB when the full 360 degree pattern is taken into account." but still overall gain is -0.5db compared to a dipole (whoppee;)

Their Moxon antenna is not....(by design Moxons radiate in a unidirectional pattern)... http://www.rf-filters.com/stress_moxon.htm is the web site...A excellent and cost effective antenna on 6
for those who cannot afford a large yagi, etc yet want a directional antenna with some gain (and bandwidth too!)

No I dont work for PAR or have ANY affiliation with them...but am damn impressed with their products,
their honesty on the facts and costs ;)

(What freq is the Midland machine Gordy???)
True, I would chaulk it up to noone being on freq and the band conditions being dead!

BTW most 6mtr rptrs (from my years on 6 and low band commercial FM) are done wrong..
single site duplexed 6mtr rptrs (and even those split site) without a Noise Blanker is
in my professional (and humble:) opinion just plain dumb...
The rcvr looks great on the bench but then they fail to check it on site for effective
sensitivity...
(see my article on the tech pages at http://6mt.com for more info)
I had Micor and GE base stations on 48MHz that heard 0.2uv for 12 DB Sinad on the bench...
at the site and the antenna connected, it went to an effective 200uV!!!!
Once a rcvr with a NB was installed and setup, it dropped to a 20uV sens...and mobiles
could now
work it even farther! But most 6mtr rptr ops fail to check this...they dont realize normal
natural
static tends to peak around 45-65 MHz (why TV2 thru 4 gets noisier than the upper
channels)..

Hence, you can HEAR the rptr, but it cannot hear you! (pity isnt it??)
The best 6mtr rptr would involve a split site with a voter and all rcvrs having a NB in
them...
to allow HTs to use the rptr from most areas...
OR just set up for mobiles and ignoring the antenna inefficiency of the HT, a single site
duplexed system will work IF the rcvr has a decent IF based NB...(the Mot MICOR/Motrac, etc
and GE MSTR II, etc series do NOT cut it here as the NB uses a separate front end/freq for
noise detection...not good for duplexer use)

NBs are not present but probably needed in MOST 6mtr operations (though people will say
otherwise; but they never check their effective sens I bet; especially on cold DRY days
when the air ionizes as it blows past an antenna and causes static buildup..its not a
pretty sight ;)

Mark: I am impressed with Par products. I have both the 6m and 2m "loops" BUT If I had it to do over I would have been better off with the Par stressed Moxon. When the band opens up (God please let the band open up soon) you'll appreciate both the front to back ratio and forward gain. It's about the same price as the OA50 loop, will really improve your ERP (to the tune of a couple of S units) and will give you the opportunity to possibly quiet down some noise (QRN or QRM). You will want to put it up with a rotor. The Radio Shack "Channel Master" is about as inexpensive as you can get and you can put a 5 or 6 foot mast on top of the rotor with the antenna up on top. As you progress into a hardcore 6 meter fanatic you'll want a bigger / better antenna (as well as lots of other things) and I think the Par would make a great rover antenna. Good luck and hope to work you on 6.

Thanks for the positive report Doug. It looks like the way to go. I've been a ham for 25+ yrs and never got on 6. I'm using a Tentec xverter. Seems to work ok, but I never hear anything on 6 with my dipole at 15ft. I made a commitment to myself that all my radio toys have to come out of my Ebay paypal act for a while. So I'm just trying to sell a couple more little things to get the $$ to order one. Hopefully that will be settled by next week. Isabel bent my existing mast at about 45 deg. Been up for 10 yrs and through all kinds of wind. Winds came from the East with this one and damaged some things never before effected. I guess I'll be buying a couple more Radio Shack masts. Thats the only place locally I could find anything. I see a tower in the near future also. At least a small one for the VHF stuff. My wire antennas work fine on HF.

Tnx agn

Mark: I am impressed with Par products. I have both the 6m and 2m "loops" BUT If I had it to do over I would have been better off with the Par stressed Moxon. When the band opens up (God please let the band open up soon) you'll appreciate both the front to back ratio and forward gain. It's about the same price as the OA50 loop, will really improve your ERP (to the tune of a couple of S units) and will give you the opportunity to possibly quiet down some noise (QRN or QRM). You will want to put it up with a rotor. The Radio Shack "Channel Master" is about as inexpensive as you can get and you can put a 5 or 6 foot mast on top of the rotor with the antenna up on top. Mark: This is my first year as a Ham. Got my Tech ticket in February, played with 2m FM for a while before I got real bored with repeaters. Got into 6 meter ssb in June. I had a great summer on 6 meters first with a Par OA50 loop and then a small 3 el Yagi. I've had decent luck with using a 22 foot section of fence top rail as a mast, bracketed to the back of my chimney in four places. I'm also using a 7 foot section of top rail on top of a channel master rotor.... so I'm almost 30 feet up at the antenna. That was good for a few hundred contacts on 6 this summer but I don't know what to expect this winter. Since Sept. 2 I've pretty much been listening to white noise. I'm hoping that December and January will bring in some winter E's. Thanks

I just bought 2 11' sections of top rail. Stumbled on it at the Depot. Havent messed around with it yet. I'm hoping to use it for some antennas. If it works out, I'll get more. Cant beat the price. My other hold up is getting a tree trimmer in here. I'm on a semiwooded lot and the trees have grown a bit since I put my antennas up. I'd like to clear enough to get 3 seperate masts up and have some decent antennas for vhf/uhf. I've got an 11 ele 2m yagi. Never used it. I dont have any 2m SSB stuff. I used to work Aurora about 15 yrs ago and would like to try that again.

I have 50.125 tuned in whenever I'm in the shack/office. Heard a couple of locals, thats it so far. Worked one guy about 35 miles from here, so I know the xverter works. I hardly operate at all during the summer months. I'm an outdoor person, but I really dislike cold wx, so I hibernate most of the Winter.

3690. Six meter listening freqs

Yahoo group: 6meter (2000 — 2003)
Date: 2003-10-08 01:46:30 UTC
From: ve7baq
Topic: 3690 Message: 3690

I posted an enquiry re. 6 meter listening frequencies some time ago and received the information I asked for, but I am not sure which sideband to use when listening on 50.110 or 50.125. Here is the setup. I removed the balun from the center of my twenty meter dipole and inserted a glass insulator in it's place. I now feed it with home brew open wire feeder with about two inch spacing, fed with an SGC 237 coupler. It tunes on all bands from 40 meters to six meters. I am listening and can transmit on six meters at last! OK now, upper or lower sideband? Would love to work someone but the band seems very quiet right now, Tuesday, October 7, 2003, at 6:45 PM, PDST on the North West coast of BC. 73 Einar VE7BAQ

Watch out how much weight you put on top rail..it is thin wall and in winds WILL bend....I found out...had a V3-220 and a MFJ 1764 (? The dual dipole array for 6 and 2) up on two-11 ft joints of top rail mounted with a chimney mount...a good wind came along one night and the next day I found the top section had bent over at more than 45 degrees!!! Luckily the neighbors didnt see it :)

Use EMT conduit for anything longer than 10ft....better weight handling and ALMOST just as lightweight and cheap too!

The standard convention is LSB on anything below 10.00 MHz and USB on everything above 10.00 MHz; this is due to the history/construction of the early SSB rigs....since xtals cost a lot back then, it was found that the same xtal, when used to create 3.5 MHz or 7.0MHz in a mix, could also create a higher band IF the opposite mix and right VFO freq was was chosen (xtal + VFO for 20 and 15 instead of xtal - VFO for 75-80 and 40)..thus the lower bands ended up LSB (as only ONE SSB signal was generated and when mixed, came out the same sideband OR inverted!)
Ok, hams were cheap...but it worked!

Thus the standard was created....even though in reality, there is NO difference between the two...SSB is SSB in either LSB or USB...if set today, would we all agree on the same sideband ?? ;) There is no law stopping you from using LSB on any band above 10.00MHz...but noone may hear you correctly.....<g>

BUT now (as someone at one of my former employers would say) you know the REST of the story!

Yup...band has been quiet. Only a couple of locals here...try listening on
50.125 USB for US/Can and 50.110 USB for international. You at least have a
chance of snagging a JA or Alaska/Hawaii, or even Oceana stations (Guam, etc.).
Heh.....there may be a few ole miners in the Klondike with AM rigs still!
That is 50.400.

Anyway, hope to hear you. Worked BC this past summer, finally! Which way is
the dipole aimed?

The antenna is oriented north and south, but as it longer than a six meter dipole (it is actually my twenty meter dipole fed with open wire feeders) the pattern is probably more towards the ends. Probably more of an extended X pattern. More like 3 half waves long. I have to try some local stuff to see how it works. Einar

Chris,

The toprail has the flanged joints. Not sure I saw any conduit with joints. Years ago, I put up 40ft of conduit and it worked. Dont remember much about that installation. I remember it took about 4 of us to hoist that thing up. I'm keeping my eye open for a used TV tower that I can grab, but nothing yet. A full HD Tower project is not in the budget this year.

There are TWO distinctly different Par antennas being mentioned in this thread:

The Par Loop which does not need a rotator as it is horizontally polarized and omni-directional;

The Par SM-50 Moxon antenna which is a two element beam with gain and directivity. This antenna is horizontally polarized and uni-directional and would require a rotator.

The Sm-50 is the antenna I am getting. I am planning to use a rotator.

There are TWO distinctly different Par antennas being mentioned in this
thread:

The Par Loop which does not need a rotator as it is horizontally
polarized
and omni-directional;

The Par SM-50 Moxon antenna which is a two element beam with gain and
directivity. This antenna is horizontally polarized and uni-directional
and
would require a rotator.

Subject: [6 Meter Sked] Six meter listening freqs

I posted an enquiry re. 6 meter listening frequencies some time ago and received the information I asked for, but I am not sure which sideband to use when listening on 50.110 or 50.125. Here is the setup. I removed the balun from the center of my twenty meter dipole and inserted a glass insulator in it's place. I now feed it with home brew open wire feeder with about two inch spacing, fed with an SGC 237 coupler. It tunes on all bands from 40 meters to six meters. I am listening and can transmit on six meters at last! OK now, upper or lower sideband? Would love to work someone but the band seems very quiet right now, Tuesday, October 7, 2003, at 6:45 PM, PDST on the North West coast of BC. 73 Einar VE7BAQ

From: Doug Huchteman
Topic: 3703 Message: 3703

Well, just fired off an email to the Oklahoma Corporation Commission about my powerline interference. S3 on good days and up to S7 at times. Makes weak signal work pretty rough. I've called Okla. Gas & Electric twice in the past two months but no one has called me back. Gets past the noise blanker quite a bit. Be forewarned, if BPL is half this bad it will put an end to the Amateur Radio Service. BTW, in between the loud arcing sounds I've been hearing some MS pings on 50.125 towards the northeast. Some pretty long.

well doug
i had the same problem here in florida but luckily i was able to get the power company to come out and play with there new detection toys and they found some trees causing troubles that was a few months ago now its back so i need to call again
but just so you know if you dont get any responce from them i would call the FCC and report them hollinsworth has written up more than one power company for that type of stuff

Before you go contacting the FCC:

a.. Log the names, dates & times, & content of all calls to the utility company
b.. Build a contact list.. names, addresses, tel num, fax num, email address, etc.
c.. Are you reaching the correct department at the utility company ? There's no sense in going around with 'customer service' when it's usually the engineering department you need to talk to.
d.. If you're not getting anywhere after a few calls then send the utility company a certified, return receipt letter describing your complaint. Doing so usually may clear the administrative bottleneck and run-around you might be getting. The utility company will now note that you can prove when they received the letter.
e.. If you do finally complaint to the FCC, include copies of letters, emails, and phone logs... The FCC is very interested if the utility company is not addressing your complaint ion a timely fashion.
Remember that 'timely' is relative. Your need to clear an interference problem for this weekend's contest is generally not considered emergency by the utility company. Restoring interrupted service is generally a utility company's first priority. Hooking up new service is usually second. Collections are usually third. Planning for future demands might likely be number 4. Interference may be way down on THEIR list - your job is to move it to number 5 while still maintaining a cordial relationship with them.

Frank, you're right. While I'm not just wanting to clear my interference for a test. I've been living with it for a few months and gets on the nerves. I've had problems in getting past customer service and was transferred to CS by engineering the last time I called. Part of my problem deals with power loss and low voltage at the house at least once per week and I'm convinced that the almost constant arcing I'm hearing is connected with a fault in their grid. I'll get a certified letter out this week. Thanks

3710. Re: [6 Meter Sked] Powerline interference

Yahoo group: 6meter (2000 — 2003)
Date: 2003-10-11 22:58:40 UTC
From: Christopher Boone
Topic: 3703 Message: 3710

Frank posted some excellent info on how to document the problem, etc..
(IF you can find someone who is a fellow ham in their Telecom dept; IF
they have one that is, that's a good back door and an ace to keep!)

I used to do RFI/TVI investigation for 12+ years at my former employer
(Gulf States Utilities or GSU now part of Entergy). I was the only ham
in the telecommunications department in the Western Division at the time
and got sent on a number of such cases (because I could speak "their"
language)...I got to sit on my fat rear most of the time while the line
crew did the rough work.....but loved the overtime and cleaning up the
problems for customers!

A good way to determine the noise source yourself is:

1) make sure you have NO problems in your own house...anything after the
meter is YOUR problem....If you can power the gear off a 12v battery or
other such source, try turning off the MAIN disconnect breaker outside..
thus killing the house entirely...if the noise remains, it's definitely
NOT your problem...
2) if it IS in your wiring, open breakers one at a time to determine
which branch has it...if NOT in your wiring, and it may be coming from a
neighbors, this can be complicated...if on good terms with them, ask
them if you can have them turn off breakers in their house to determine
the noise source (NEVER do that yourself.....have THEM do it at their
house...saves you grief and trouble later)...if a problem is found, ask
them to have it fixed..do NOT offer to fix it yourself unless you are a
license electrician. If they balk, offer to pay for half of the repairs.
3) If its not in your neighbors home, then its time to look for it down
the road...or on the line...two ways to finding it: an AM rcvr (with S
Meter preferred) and yagi in the FM band to search at 88 MHz (down to 50
MHz is ok....but going lower is hard due to antenna size) AND a VHF rcvr
in the 220 band with a SMTR and portable handheld yagi to find it once
close enough.. Noise will travel down a power line like an antenna (it
IS 60Hz AC and noise is harmonics! the wire doesnt care) and can go for
MILES without attenuation..only thing that stops it is a xfmr or
capacitor bank IN LINE (home xmfrs do not stop the noise on the main line)
4) Try to traingluate the noise using the lower band antenna and
rcvr..try to find two points you can hear the noise and then figure out
where lines from those two points come together on a map....may need to
get 1/2 mile or so away from your house in either direction to get a
good bearing...if you cannot hear the noise, try to get a bearing using
your home antenna; then go and use a two point method once you can hear
it with the portable gear. Once you get a rough area where it may be,
use the HIGH end gear to pinpoint it (noise attenutates higher in freq
and thus the higher you go, the easier it is to pinpoint with a decent
yagi with decent directivity).

5) If you find it on a power company line, pole, etc DONOT attempt to do anything yourself....it is a violation of state and/or federal law to tamper with a power companies' property and needless to say, anything that happens can put you in a lawsuit situation....(this for those who think they can fix it themselves!!!)...contact the power company who is repsonsible for the poles (in states with de-regulation, it MAY NOT be the same company YOU buy power from.....in Houston, Centerpoint is the WIRES company...but they do not sell POWER..keep that in mind when calling..make sure the company you contact IS the distribution company! Make sure you give them the location, freq and noise level, time of day, wx conditions (does it go away in rain? does cold dry air make it worse?? Believe me, telling that to the folks who come to fix it will make their job easier and get it done faster....been there, done that for a living! :)
6) Remember you are not their only customer and since you are not a "revenue" job which makes them money, you may be low on the list... if they balk or do not respond in say 30 days, then its time to call in the big guns....You can reach Riley via info@... if I recall... he does have a private email.....and I think its been published before...but I will only send it to Doug directly...not in this email.. (I've chatted with Riley a couple of times in email..he IS quick to respond)...
7) Also keep in touch with your state PSC/PUC, etc....but TRY to resolve it 1st with the company if you can.....keeps them happy and if you ever have to go to them again, they remember if you called the FCC/state guys in before giving them a chance...and they get a little pissy about it!

If customer service IS a PITA (and they are not good for TVI/RFI problems; all they know is how to answer the phone), request an engineer in their Right Of Way department....or someone in their telecommunications dept ;)

Hope this helps in any way...you gotta the play the game and play it right...but eventually it can get fixed...

Mostly just loud buzzing, really bad around 3.5 mhz and 40 meters is almost totally useless. I haven't done any testing as you advised in your email but I'm planning on it. I do have a neighbor who is a line supervisor for the power company, I'm going to see if he has any interference knowledge or testing toys.

Power company employees (especially a line supervisor) are always a good thing to have as a neighbor if you're a ham! :)
If its loud BUZZing, that likely is something arcing bad OR burning (a mild arc causes a mild buzz....a BURN or bad arc is 10x worse in the sound from my experiences....20kv single ph/35kv 3 phase is the worst!!) should be easy to find if its constant and you can DF it...

Good luck....let us know how it turns out..

Probably PC or cable TV! PC microporcessors are usually xtalled on even freqs and because they are digital, they operate with squarewave and not sine waves....square waves are sine waves PLUS all the harmonics..thus a PC will put out spurs or carriers on a number of freqs depending on the divide-by and other factors of the processor and the bus...(as well as the actual xtal freq used)....it is not uncommon to hear PC spurs on even freqs like 144.0 and 50.000 as well as other freqs..Try turning off ALL the PCs in your house to see if it goes away...(could also be a processor spur from a remote control, TV, etc!)

BUT it could also be CATV leakage...usually CATV channel 18 video is 145.25 MHz (also called Midband Channel E)..but on some systems called HRC, which the channel are harmonically related, the channel is shifted down to an even freq and hits right on 144.000 MHz...

Here is a list of the CATV channels in all their formats (MOST are STD but the IRC and HRC systems are used in some metro areas):
http://www.arrl.org/tis/info/catv-ch.html

Power line NOISE is wideband...and would not be heard on a specific freq....but rather over a wide range of freqs....or bands..

Six meters is the worst ham band for noise since natural broadband noise peaks between 40 and 75MHz with the middle being TV2 and 6mtrs..This is why TV 2,3 and 4 are usually the noisiest reception off air (with 2 being the worse) On 6mtrs a Noise Blanker is almost always a requirement except in rare quiet cases! :)

I know this sounds odd, try putting water around your grounding rod!
If you have a chain link fence, bind all the corners with copper strap and ground to the fence.
Way out west, we have tile (cinder block) fences and caliche soil, in a very dry
environment (less than 10 inches rain a year). Good grounding is a real problem, both for amateur radio rigs
AND power equipment.

From: Brian McClure
Topic: 3720 Message: 3720

Well I finally got an antenna installed that doesn't give my neighbors and myself tons of TVI.

I'm using a High Sierra HS1500-MKII screwdriver antenna. Mounted on a 4ft steel pole driven into the ground about 2 feet, outside my town house, with 2 10ft radials.

It tunes up great on 6M and doesn't cause any TVI.
Now I just have to wait for a band opening to see how it works on the air.

From: George Clark
Topic: 3723 Message: 3723

I have a question for the Hams that check qsl cards for certificates! If you receive one qsl card with four or five different Freqs. on it. Is that qsl card good if you send it in? I've only had it happen to me twice in 20 years but I don't know if it is good or not. George

3728. Repeater "beacon" IDs etc..

Yahoo group: 6meter (2000 — 2003)
Date: 2003-10-15 22:41:10 UTC
From: Keith
Topic: 3728 Message: 3728

Well on 6 and 10 meters (when open), a repeater that IDs all the time is a pain!!
Not to mention the ones with 10 second hang times and carrier Squelch!!
My interpretation of the rules as an OO, is that a repeater that transmits without being keyed up is either;
1. Sending a "cleanup ID", ie there was activity within 10 minutes of it's last ID---OK
2. Sending info of interest to hams--OK, open to interpretation (an ID or the time is NOT included).
3. Broadcasting--not OK, The time is considered broadcasting.
4. A beacon--Not normally OK for a repeater....see the rules on beacons.
5. there are probably others...
The reason this problem is not addressed is most repeaters are on bands that don't skip. They have limited coverage areas and are coordinated to have minimal overlap with other channel users....

> b.. Build a contact list.. names, addresses, tel num, fax num, email address, etc.
> c.. Are you reaching the correct department at the utility company ? There's no sense in going around with 'customer service' when it's usually the engineering department you need to talk to.
> d.. If you're not getting anywhere after a few calls then send the utility company a certified, return receipt letter describing your complaint. Doing so usually may clear the administrative bottleneck and run-around you might be getting. The utility company will now note that you can prove when they received the letter.
> e.. If you do finally complaint to the FCC, include copies of letters, emails, and phone logs... The FCC is very interested if the utility company is not addressing your complaint ion a timely fashion.
> Remember that 'timely' is relative. Your need to clear an interference problem for this weekend's contest is generally not considered emergency by the utility company. Restoring interrupted service is generally a utility company's first priority. Hooking up new service is usually second. Collections are usually third. Planning for future demands might likely be number 4. Interference may be way down on THEIR list - your job is to move it to number 5 while still maintaining a cordial relationship with them.

From: Doug Huchteman
Topic: 3732 Message: 3732

Still haven't heard anything from OG&E about my power interference BUT while sniffing around I did discover a Cable TV leak behind my yard. At 08:30 local today I called Cox Cable. At 11:30 local I had a service person on site. Now this person is an installer and didn't even know how to use the equipment. He struggled with the test set (a field strength meter) and tracked down the leakage to the cable stub for my house. He called a line tech supervisor who was at my house at 14:30 local. It was apparent that he really didn't believe that cable could cause interference with ham radio. I showed him my radios and the signal on 145.250 and he got out his test equipment. I showed him how I had run my test with a 2m HT and he duplicated it with his equipment. Putting a line analyzer on the cable and found numerous leaks along a 96 foot section of main line behind my house. This weekend they'll replace the main line. Nice guys, showed real interest in ham radio, and did their jobs in a nice professional manner. Now if I can only get OG&E to even just call me back. Doug Huchteman KD5VHZ EM15

3735. Re: [6 Meter Sked] Powerline interference

Yahoo group: 6meter (2000 — 2003)
Date: 2003-10-19 16:35:08 UTC
From: Christopher Boone
Topic: 3703 Message: 3735

As long as it is cut and isolated in the proper places to be resonant, gutter would work as a dipole on 6.....but the ends MUST be isolated from the remaining gutter to prevent arcing with RF and the center where you feed it will also require such insolation (plastic, fiberglass, etc)....so you can properly connect the feedline...with the gutter being BELOW the rooftop, you may not radiate as well as a dipole in the clear could do..
also make sure the nails holding the gutter do NOT contact any metal, etc inside the roof.....and the nails should not be at a high current point....this could cause heating of the wood and possible fire under high RF or high SWR conditions....

But if done safely, it can be done.....

Ken,
I am in El Dorado Hills, east of Sacramento. I am participating in the BEACONet work on 6 meters.

The web site is:http://www.BEACONet.org

We've been doing propagation experiments for several years now on 6 and other bands.

Both AX.25 /FM and PSK 31 on SSB are used.
I have the equipment to work on PSK31, but don't have it presently set up yet at my new location here. However I am running an almost 24/7/365 beacon on 50.620 MHz. This is the AX.25 running UIVIEW software. Give us a look, check the web site out to see soon of the results.

I can set up the PSK31 stuff in a few weeks and get a propagation beacon going. We operate on 50.291 USB/PSK31.

OK

Our Pacific div convention is over..:(

I got me a Rigblaster plus to do PSK31 on 6.

Is there a freq. to use for this mode?

Is there anyone on there?

Actually if it were made out of a thicker material like 1" tubing to broad band it, it probably would work. Each side of a half wave dipole is a quarter wave. Any odd multiple of a quarter wave is resonant ie. 1/4 wave, 3/4 wave. 5/4 wave. I am going to round off numbers for the sake of making it easy, but a half wave dipole that is resonant at 50mhz (1/4 wavelength) is also resonant at 150mhz (3/4 wavelength) and 450mhz (9/4 wavelength). If you make the dipole out of tubing insted of wire it will make the antenna more broad and it will probably work. I use a 2m quarterwave whip on my truck on 440mhz and it works fine. Anyway, the formula for figuring the length of an half wave dipole is 468/ Frequency in Mhz. So, 468/50Mhz = 9.36 feet, or about 9ft 4in. Remember that is the total length of the dipole, so you will have to divide that by 2 to get the length of each half of the dipole.

Having said all that. On 2m and even more so on 70cm, the antenna will start to become more directional off of the ends of the diople. Keep that in mind for your orientation when you put it up. Electrically the longer the antenna is the more directional it becomes off the end.

Hope this helps,
73,
Kevin N4KM

ZCZC AP43

Propagation Forecast Bulletin 43 ARLP043
From Tad Cook, K7RA
Seattle, WA October 24, 2003
To all radio amateurs

SB PROP ARL ARLP043
ARLP043 Propagation de K7RA

Big news this week is a colossal sunspot that appeared on Sunday, October 19. It first emerged at about seven times the earth's diameter, but two days later on Tuesday, it had grown to around the size of Jupiter, which is equivalent to eleven earth diameters. This is one of the largest sunspot groups to appear during the current cycle 23. Along with this large spot have been coronal mass ejections, keeping the earth's magnetic field upset, and an additional spot by mid-week. An ejection caused a radio blackout on Sunday around 1650z.

This is a big change from the recently spotless sun. Now a large coronal mass ejection threatens, and the predicted arrival time is Friday, October 24. This is not good news for contesters who hoped to work the CQ Worldwide DX SSB Contest this weekend. Currently on Thursday evening, the forecast is for a planetary A index of 50 for Friday through Sunday, October 24-26, but this could be a modest projection. Solar flux has risen since October 14 when it was only 92, and should top 200 by the middle of the coming week.

The growing solar activity is dramatic enough that it is now national news. Check the following sites for articles.

http://www.msnbc.com/news/984388.asp?cp1=1

http://seattlepi.nwsource.com/national/144998_solar23.html

http://www.al.com/news/huntsvilletimes/index.ssf?/base/news/1066931170176140.xml

http://the.honoluluadvertiser.com/article/2003/Oct/23/ln/ln14a.html

http://rockymountainnews.com/drmn/state/article/0,1299,DRMN_21_2369006,00.html

The solar flux value of 191 shown below for October 22 is the value measured at the Penticton observatory. The number from the NOAA Space Environment Center was lowered to 154, probably because of a flare enhancement to the Penticton reading. Those who keep records

may want to lower the value for that day to 154 from 191, which would make the week's average for the daily solar flux 123.4 rather than 128.7. Not shown here is the following day, October 23, when the observatory at Penticton measured 209.3 and the SEC reported it as 183. These seem to be estimates based upon the morning measurements made three hours before local noon, which were both around 154 and 183 for the two days.

Sean Blackburn, KB7OOH of Everett, Washington wrote to inquire about a source for sunspot numbers to use with the W6ELprop software for propagation prediction. The numbers are at, http://www.sec.noaa.gov/ftpdir/indices/DSD.txt.

It is probably best to average several days of sunspot numbers to use with this program. As always, it is available free at. http://www.qsl.net/w6elprop/.

For more information about propagation and an explanation of the numbers used in this bulletin see the Propagation page on the ARRL Web site at http://www.arrl.org/tis/info/propagation.html.

Sunspot numbers for October 16 through 22 were 28, 66, 91, 89, 113, 144 and 117, with a mean of 92.6. 10.7 cm flux was 95.2, 98.8, 108.6, 120.4, 135.1, 151.5 and 191, with a mean of 128.7. Estimated planetary A indices were 26, 31, 27, 32, 30, 39 and 33, with a mean of 31.1.

Hi Andy
Hey, six meters is ALWAYS a crap shoot.
I even try the band during local thunder storms.

I do think that the band maybe open at odd times, such as midnight.
The possibility of aurora is higher, listen for "hollow" side band,
particularly
if you are near or above the 45 parallel. Look on 2 M ssb also.

Gordy Tatro N5FLV, way down south y'all

Thanks for the tips. I'm at the 39th parallel, but I'll give is a shot
with the beam pointed north.

Gordy Tatro wrote on 10/24/2003, 1:59 PM:

3768. Re: [6 Meter Sked] SOLAR STORM AND 6MTRS

Yahoo group: 6meter (2000 — 2003)
Date: 2003-10-24 20:12:48 UTC
From: scott woodruff
Topic: 3760 Message: 3768

HI, Wade
I read your comment,regarding the solar storm, my best
adice to you is to watch the solar flux if it goes up between
100-200 and the kp values also rise 5 and higher this will
be good for vhf,but not good for hf,also with the rise in kp
values watch for aurora activity to the north,thus a good
6meter op. will be monitoring 1 to 2 days after the storm.
and as always listen,listen and listen more, and have fun
on the magic band and good dxing.

3771. put officials in Manassas, Virginia, on notice

Yahoo group: 6meter (2000 — 2003)
Date: 2003-10-25 13:54:34 UTC
From: worksntv@aol.com
Topic: 3771 Message: 3771

The ARRL this week put officials in Manassas, Virginia, on notice that the League will act on behalf of its members to ensure full compliance with FCC regulations when the city's Broadband over Power Line (BPL) system starts up in a few months. The League was responding to media reports that Manassas--a Washington, DC, suburb--has approved plans for a citywide BPL rollout.

More than likely weather....there is a MASSIVE cold front moving thru Texas right now.....that acts as a giant reflector in the sky a lot of times.....also could be stirring up the atmosphere and causing some ducting....

The sun ejections COULD have something to do with it but I think they would have passed us by now (it was due to hit late Friday IIRC)....

Right now its quiet here in Houston....been listening between the static crashes of the storms earlier...and its quiet for now...though we are supposed to see more later...but looking at the NOAA wx radar, it's pretty well quieted down to the north and west of us.

Hi everyone,
I purchased a RCI5054 DX100 and the Comet 4el beam.. Everything appears to in great working order. I've been on the air listening over two weeks, scanning between 50.00 - 51.000 at different times and NOT heard anything.. Is the band that dead? Anyone want to try a contact, give me a date and time...

3791. RE: [6 Meter Sked] Re: 50mhz 6 meters opening in EM20

Yahoo group: 6meter (2000 — 2003)
Date: 2003-10-27 13:34:28 UTC
From: M. Walton
Topic: 3786 Message: 3791

Dan,

The band is dead 95% of the time. But when it opens, you can work all over. Were you listening Sat night? There was a pretty good opening late saturday into the nite. I was still hearing action at midnight.

Hi everyone,
I purchased a RCI5054 DX100 and the Comet 4el beam.. Everything appears to in great working order. I've been on the air listening over two weeks, scanning between 50.00 - 51.000 at different times and NOT heard anything.. Is the band that dead? Anyone want to try a contact, give me a date and time...

3793. RE: [6 Meter Sked] Re: 50mhz 6 meters opening in EM20

Yahoo group: 6meter (2000 — 2003)
Date: 2003-10-27 13:44:50 UTC
From: M. Walton
Topic: 3786 Message: 3793

Dont know what to tell you there Dan. There was definately activity in many parts of the country. There may not have been an opening in your location. I am fairly new to 6 meters myself and still learning 6m propogation.
Keep listening. I keep mine on 50.125 whenever I'm in the shack. I use a TS450 w/ Tentec Xverter. 8w to a PAR Moxon at 20 ft. I plan on gettoing the antenna higher next weekend. QRP is diificult sometimes on 6m, but I do manage to make contacts.

3795. RE: [6 Meter Sked] Re: 50mhz 6 meters opening in EM20

Yahoo group: 6meter (2000 — 2003)
Date: 2003-10-27 15:30:41 UTC
From: M. Walton
Topic: 3786 Message: 3795

Dan,

That is the calling freq. If the band opens, you'll hear activity there.

Hi everyone,
I purchased a RCI5054 DX100 and the Comet 4el beam.. Everything appears to in great working order. I've been on the air listening over two weeks, scanning between 50.00 - 51.000 at different times and NOT heard anything.. Is the band that dead? Anyone want to try a contact, give me a date and time...

3796. Activity hints to N9BYY

Yahoo group: 6meter (2000 — 2003)
Date: 2003-10-27 16:14:32 UTC
From: J Dyer
Topic: 3786 Message: 3796

Hello Dan,

Welcome to 6 meters. It is very appropriately called the "magic band" because the band openings can come and go like magic.

Here are a few hints to help you get started on 6 meters. First, acquaint yourself with the band plan.

50.0 -50.100 is exclusively CW.
50.100 and above is both SSB and CW.

That is the "legal " part but in actual practice, there is a gentlemen's agreement that divides activity up for everyone's benefit.

50.000-50.090 CW Beacons. Don't try to work one. They don't qsl very good. If you hear a signal in this area of the band, six is open to somewhere. Sometimes you will hear a beacon but no activity up the band. Six may be open from your qth to some area but no on is on the air at the other end of the link.

50.090-50.100 General CW

50.100-50.125 Reserved for DX qso's. This is the segment of 6 meters that a lot of the magic occurs. A brief weak opening into South America could be covered by two stateside stations rag chewing. The DX calling frequency in this sub band is 50.110. If you hear a station from Jamaica calling on 50.110, go for it. If your neighbor calls you on 50.110, suggest that he move a bit higher in the band out of respect to the other hands that are interested in working DX.

50.125 and above. All normal SSB activity with an occasional CW signal heard.

50.125 is the 6 meter calling frequency. Leave you radio on this frequency every waking moment. You will get used to the hiss and buzz eventually. The family will either throw you and the radio out or get used to it also. You might want to set up a baby monitor by the receiver so you can listen while at the shop, pool, etc. so you will never miss an opening. Seriously, the odds of walking into the ham shack, turning the radio on, and instantly hearing a 6 meter opening are not good. Leave the receiver on the calling channel as much as possible and you increase your odds of catching an opening. It wouldn't hurt to call CQ on 50.125 occasionally. It could be a case of everyone listening and no one talking. If the band opens up, don't monopolize the calling frequency. Move up the band and have fun. A good opening can generate activity from 50.125 all the way up to 50.200 or higher. Remember that all stateside qso's are from 50.125

and up, not down.

Do as I say, not as I did. I bought a 706 for the XYL , put up a 6 meter dipole, and randomly checked for an opening. It was 6-8 months before we ever heard a signal on 6 meters. Two years later she has over 400 contacts and 47 states on 6 meters.

Have fun,

John
AE5B

3797. RE: [6 Meter Sked] Re: 50mhz 6 meters opening in EM20

Yahoo group: 6meter (2000 — 2003)
Date: 2003-10-27 16:39:54 UTC
From: KD5SFA
Topic: 3786 Message: 3797

I know that there was an opening from Colorado to Texas last night.... 50.130 and 50.180
It kept fading in and out. I was unable to get through on a vertical with 10 watts.
I need to get my moxon up real soon. It'll only be about 15 - 18' for the time being but it should work okay...I hope.

73,
Jon

From: Einar Carlsen
Topic: 3798 Message: 3798

Thank you for posting this bulletin to the reflector John. I have been looking for a bit of a guide to what to look for. Most of us know that we might have a long wait for a contact but it helps to have a bit of a guide as to what to look for. I am a long way from the next town. Prince Rupert is on the northwest coast of British Columbia. The next stop north is Ketchikan Alaska and the next south is Vancouver BC, about 500 miles as the crow flies. I will be listening, and listening. Einar VE7BAQ

Subject: [6 Meter Sked] Activity hints to N9BYY

Hello Dan,

Welcome to 6 meters. It is very appropriately called the "magic band" because the band openings can come and go like magic.

Here are a few hints to help you get started on 6 meters. First, acquaint yourself with the band plan.

50.0 -50.100 is exclusively CW.
50.100 and above is both SSB and CW.

That is the "legal " part but in actual practice, there is a gentlemen's agreement that divides activity up for everyone's benefit.

50.000-50.090 CW Beacons. Don't try to work one. They don't qsl very good. If you hear a signal in this area of the band, six is open to somewhere. Sometimes you will hear a beacon but no activity up the band. Six may be open from your qth to some area but no on is on the air at the other end of the link.

50.090-50.100 General CW

50.100-50.125 Reserved for DX qso's. This is the segment of 6 meters that a lot of the magic occurs. A brief weak opening into South America could be covered by two stateside stations rag chewing. The DX calling frequency in this sub band is 50.110. If you hear a station from Jamaica calling on 50.110, go for it. If your neighbor calls you on 50.110, suggest that he move a bit higher in the band out of respect to the other hands that are interested in working DX.

50.125 and above. All normal SSB activity with an occasional CW signal heard.

50.125 is the 6 meter calling frequency. Leave you radio on this frequency every waking moment. You will get used to the hiss and buzz

eventually. The family will either throw you and the radio out or get used to it also. You might want to set up a baby monitor by the receiver so you can listen while at the shop, pool, etc. so you will never miss an opening. Seriously, the odds of walking into the ham shack, turning the radio on, and instantly hearing a 6 meter opening are not good. Leave the receiver on the calling channel as much as possible and you increase your odds of catching an opening. It wouldn't hurt to call CQ on 50.125 occasionally. It could be a case of everyone listening and no one talking. If the band opens up, don't monopolize the calling frequency. Move up the band and have fun. A good opening can generate activity from 50.125 all the way up to 50.200 or higher. Remember that all stateside qso's are from 50.125 and up, not down.

Do as I say, not as I did. I bought a 706 for the XYL , put up a 6 meter dipole, and randomly checked for an opening. It was 6-8 months before we ever heard a signal on 6 meters. Two years later she has over 400 contacts and 47 states on 6 meters.

Have fun,

John

Yeah its been that dead depending on your area.....
Put these freqs in the radio for memory scanning (and of course add to it as the need arises)

50.063 (beacon)
50.066 (beacon)
50.073 (beacon)
50.076 (beacon)
50.110
50.125
50.200
50.400 AM
52.525 (need a vertical for local QSOs here :)

No need to scan to 51.000 (50.8-51 is RC models anyway...it could be DANGEROUS to transmit there as you could
cause a plane crash which may injure or even kill someone)

Just keep the faith Tom....get on 50.125 and call CQ once in a while...if everyone is listening,
who's gonna be calling?? :) Ya never know..

6 can be "dead" for a LONG while but local contacts can still be over 100 miles with what you have...
you just need to find the "local" ops :) but when the band opens, you'll forget all about the dry times.

From: 06993
Topic: 3801 Message: 3801

I tried to work this past Saturday's 50-MHz sprint, but
did not have any luck. I was not able to get my Par OA-50
in the air, so all I had was my 6M mag-mount vertical on the
roof of the mini-van. I heard several QSO's, but could not
work any of them.

I'll keep listening ...

Another thing to do is check for when 6 meter and
UHF/VHF contests are held ... sometimes you can get a
good opening then and make a lot of good contacts.

I've done that and made some good contacts from my
QTH in EN91 into Florida, Mississippi, and Texas.
With a Dipole and 8 W no less ....

Good Luck!

Jon,

Just put up my Moxon at 20' this weekend. Running 8 watts here in FN10.
Been able to work a few. I hope to get some more height this weekend.
Will be working QRP for a while.

I know that there was an opening from Colorado to Texas last night....
50.130 and 50.180
It kept fading in and out. I was unable to get through on a vertical
with 10 watts.
I need to get my moxon up real soon. It'll only be about 15 - 18' for
the time being but it should work okay...I hope.

73,
Jon

Tnx Mark for the advise. I'll try the 50.125.
Dan

"M. Walton" <mark@...> wrote:
Dont know what to tell you there Dan. There was definately activity in
many parts of the country. There may not have been an opening in your
location. I am fairly new to 6 meters myself and still learning 6m
propogation.
Keep listening. I keep mine on 50.125 whenever I'm in the shack. I use a
TS450 w/ Tentec Xverter. 8w to a PAR Moxon at 20 ft. I plan on gettoing
the antenna higher next weekend. QRP is diificult sometimes on 6m, but I
do manage to make contacts.

Magic is right. I drove 400 miles across West Texas visiting field
day sites on the first day of FD2003 and worked only one station on 6.
It was XE2HWB on the southern tip of Baja California in Mexico and he
answered my CQ. The trip back the next day was better with a good
opening into southern Florida but the first day wasn't too bad.
Mexico from the mobile on 6 meters was OK.

The magic lives.

And don't forget about all the stupid HTML e-mails that are sent out
when they aren't even needed. Did everyone know that HTML mails are
TWICE the size of a plain text message? And thats is when there is only
text in the message.

And yet another HTML mail virus has been released in the last month that
you only need to view the message to get infected.

Thats the main reason I NEVER download my e-mail under windows.

3812. Starting in 6 meters with Tech

Yahoo group: 6meter (2000 — 2003)
Date: 2003-10-29 00:10:45 UTC
From: taylormack
Topic: 3812 Message: 3812

Just last week I received my Tech license, and although I hope to upgrade to a General license, my work schedule right now precludes even attempting to start learning CW for at least the next 6 months. That leaves me largely with 2m and 6m to play on for the near future, and I would like to try my hand at DX with SSB.

The problem is cost (like with most people). If only the cost of an ICOM 706MKIIG was half the price! I have been looking at the Ranger 5054DX-100 and the Ten-Tec 526 6N2 as alternative beginning radios. The price of the Ranger is affordable, but it does not cover 2m. The Ten-Tec covers both 6m and 2m with SSB, but the cost is a good bit higher. One option was to get the Ranger (low price for 6m multi-mode) and get a nice dual band HT with a few accessories to use in the shack as well as the office and truck.

I want to operate from home and mobile in my truck on long trips (not everyday driving), so will need both a mobile and base antenna (unless somebody has a suggestion for one antenna for both purposes), and a power supply. Of course, the transceiver, too.

Any suggestions, advice, help, comments for a newbie would be appreciated. Have been reading some of the previous messages and learning alot. Glad I found this group.

Save your money.... Get the BEST you can afford right
now, and then spend MORE on an antenna... Ive GOT a
706mk2g and am EXTREMELY happy with it. If you get
LESS then you will ALWAY be looking to upgrade. If you
are looking for SSB DX, an HT WONT be the rig for
you... Check Ebay and consider an older 706. If you
are NOT looking for 440, then a Mk2 is a good starting
point. You can always upgrade to an amp later on.

Taylor, congrats on the new license. I started out on 6 with the Ranger 5054DX (25 watts) and have upgraded to the 706MKIIg. My reason to start with a Ranger was also cost and I wanted to find out if I enjoyed ssb and 6 meters. I'm now a 6 meter addict. I love the band (except when it's dead and then I hate it <grin>).

I really like the Ranger 5054DX and wish I'd gotten the 100 watt model. I still use mine in the "company car" with a nmo mount Tram whip. When the band is open I can work E skip from the car. For SSB you really need a horizontal antenna BUT when you work E skip the signals come back down skewed and a vertical will work. You lose 20db of signal when working locals though! I didn't think they would let me mount a loop antenna on the car or I'd do it in a heart beat.

With 2 meter ssb it's a different story. No E skip and you really need a good 2 meter loop. You'll be working Tropo signals and most of them are pretty weak, you can't afford to lose 20db. Luckily you have a truck and maybe you can mount a mast for the loop antennas.

Ok, for base antenna. General rule, beam antenna with the most gain mounted as high as you can get it. I started on 6 with a Par OA50 at 20 feet and worked some openings. I now have a 3 element beam at 40 feet and hear so many more stations than I could on the loop. IMHO go with a beam from the start and put it up in the air as far as you can safely go. Several companies make small inexpensive beams that can be turned with a small radio shack rotor. Par makes their MOXON beam and MFJ makes a 3 element Yagi that works amazingly well both cost about $80. Rotor and control cable will run about the same price. If you can't afford that go with the Par loop or an M2 loop and save up for the upgrade.

As for the Icom 706MKIIg. It really isn't much more than the TenTec 6N2 and you get all the HF bands and UHF too. 5 times the power on 6 meters and over twice the power on 2 meters. More bells and whistles than you'll need for a long time plus good DSP. You might be able to locate a good used one for sale? Look for the MKIIg model though because earlier models have lower power on 2 meters and are not as capable.

Power supply..... 25 amps will run any of the radios we have been talking about with no problem. I saw a used Astron 25 amp PS at a swap meet last Saturday for $30 bucks and several 35 amp models for less than $90.

I'm not a fan of HT's, just my preference. But they will serve to talk on local 2 meter repeaters if that suits you. Hook one up to a base antenna and it helps.

Hope this helps some. I'll look for you on 6.

Well shoot, if we're talking about the 706, consider the FT-100D. Comes with much more standard and is just a better rig in my opinion.

OK after reading the stuff others have written, I shall add my own thoughts.

1. I agree that you should try to get the best radio you can. I have a 706MKIIG and I love it. It will do everything I need in a radio, all bands all modes. Really sweet.

2. 6 meters is fun, but spotty. It is not always open. This does not mean you should ignore it - think of it as a challenge! When you do catch an opening the wait makes the experience that much more rewarding.

3. Two meters SSB is cool, but there is much more activity on FM. You might want to skip on 2m SSB in order to get a better antenna for 6 meters.

Now you also mentioned base and mobile operation. This is where things get tricky. Where do you expect to do the most operation? If you can only afford one nice rig you have to choose where to install it. For my use, I put my 706 in my house, and for a truck radio I have a 2m/440 FM rig. I do not do a lot of operation from my truck, I subscribe to Sirius Satellite Radio and I upgraded the factory speakers and added an amp - so needless to say I listen to a lot of tunes while mobile.

No mobile antenna can ever be as good as a base station antenna. This was another reason I decided to use the 706 as a base unit.

No matter what you decide to go with, I wish you the best of luck with 6 meters and your quest to upgrade to HF. Think hard about what you want, and how you want to operate it, then go with your best options for your budget. We all have to make trade offs unless our last name happens to be Kennedy, Forbes, or Gates.

PS another reason to go with a 706 right now is motivation! Nothing motivates you to upgrade your license more than a HF rig ready to go! Before I had my HF license I would spend hours scanning the HF bands for ham traffic and also for shortwave radio broadcasts. Lots of fun!

-- James KF4OUI

Just last week I received my Tech license, and although I hope to
upgrade to a General license, my work schedule right now precludes
even attempting to start learning CW for at least the next 6 months.
That leaves me largely with 2m and 6m to play on for the near future,
and I would like to try my hand at DX with SSB.

To: 6meter@yahoogroups.com
Subject: RE: [6 Meter Sked] Re: 50mhz 6 meters opening in EM20

7eah its been that dead depending on your area.....
Put these freqs in the radio for memory scanning (and of course add to
it as the need arises)

50.063 (beacon)
50.066 (beacon)
50.073 (beacon)
50.076 (beacon)
50.110
50.125
50.200
50.400 AM
52.525 (need a vertical for local QSOs here :)

No need to scan to 51.000 (50.8-51 is RC models anyway...it could be
DANGEROUS to transmit there as you could
cause a plane crash which may injure or even kill someone)

Just keep the faith Tom....get on 50.125 and call CQ once in a
while...if everyone is listening,
who's gonna be calling?? :) Ya never know..

6 can be "dead" for a LONG while but local contacts can still be over
100 miles with what you have...
you just need to find the "local" ops :) but when the band opens, you'll
forget all about the dry times.

3824. Question Ref. PAR Moxon

Yahoo group: 6meter (2000 — 2003)
Date: 2003-10-29 22:09:25 UTC
From: MadDrewski@aol.com
Topic: 3824 Message: 3824

Noted a few folks mentioning that they had the PAR Moxon...I've got a lot of respect for Dale (owner) and was wondering how the Moxon is working. I was going to homebrew one, but Dale's has a very low visual impact (and mine would be more noticeable, thus the reason for the question). Anyone have any comments on the Mox versus a Yagi? Natch, a Yagi will outperform the Mox, but is it substantial? I'm running his OmniAngle at present, think I can get away with the Mox if I can disguise the rotor.....

Tnx!
Andrew

Topic: 3826 Message: 3826

I put up my homebrew moxon monday.....it's not up high enough...too windy to
get on the house and attach it to my higher mast.
It is getting some intereaction from the roof so swr is a little high. My
tuner is taking care of that for now. The resulting losses
bring my 10 watts down to about 4.... I hope to move it to the higher
location tomorrow or Friday if the wind cooperates.

I may go ahead and take it down now and put the ringo in it's place since I
know it works and that will be one less thing to do before
darkness falls tomorrow and I'll have a better chance of having it up higher
by tomorrow night..

73,
Jon

Einar, Earl is in P.G. I haven't neard him in Vancouver but you might be able to. My beam has been pointing North for aurora, but I haven't heard him, you, or anything else! I don't know if he is on this group, so try emailing him for a sched. earl_dugdale@....

BTW there is an excellent guide to the Magic Band, but I can't locate it now for the author or title. But you can get it from Worldradio (NOT Radioworld in TO).

Thank you for posting this bulletin to the reflector John. I have been looking for a bit of a guide to what to look for. Most of us know that we might have a long wait for a contact but it helps to have a bit of a guide as to what to look for. I am a long way from the next town. Prince Rupert is on the northwest coast of British Columbia. The next stop north is Ketchikan Alaska and the next south is Vancouver BC, about 500 miles as the crow flies. I will be listening, and listening. Einar VE7BAQ

Subject: [6 Meter Sked] Activity hints to N9BYY

Hello Dan,

Welcome to 6 meters. It is very appropriately called the "magic band"
because the band openings can come and go like magic.

Here are a few hints to help you get started on 6 meters. First,
acquaint yourself with the band plan.

50.0 -50.100 is exclusively CW.
50.100 and above is both SSB and CW.

That is the "legal " part but in actual practice, there is a
gentlemen's agreement that divides activity up for everyone's benefit.

50.000-50.090 CW Beacons. Don't try to work one. They don't qsl very
good. If you hear a signal in this area of the band, six is open to
somewhere. Sometimes you will hear a beacon but no activity up the
band. Six may be open from your qth to some area but no on is on the
air at the other end of the link.

50.090-50.100 General CW

50.100-50.125 Reserved for DX qso's. This is the segment of 6 meters that a lot of the magic occurs. A brief weak opening into South America could be covered by two stateside stations rag chewing. The DX calling frequency in this sub band is 50.110. If you hear a station from Jamaica calling on 50.110, go for it. If your neighbor calls you on 50.110, suggest that he move a bit higher in the band out of respect to the other hands that are interested in working DX.

50.125 and above. All normal SSB activity with an occasional CW signal heard.

50.125 is the 6 meter calling frequency. Leave you radio on this frequency every waking moment. You will get used to the hiss and buzz eventually. The family will either throw you and the radio out or get used to it also. You might want to set up a baby monitor by the receiver so you can listen while at the shop, pool, etc. so you will never miss an opening. Seriously, the odds of walking into the ham shack, turning the radio on, and instantly hearing a 6 meter opening are not good. Leave the receiver on the calling channel as much as possible and you increase your odds of catching an opening. It wouldn't hurt to call CQ on 50.125 occasionally. It could be a case of everyone listening and no one talking. If the band opens up, don't monopolize the calling frequency. Move up the band and have fun. A good opening can generate activity from 50.125 all the way up to 50.200 or higher. Remember that all stateside qso's are from 50.125 and up, not down.

Do as I say, not as I did. I bought a 706 for the XYL , put up a 6 meter dipole, and randomly checked for an opening. It was 6-8 months before we ever heard a signal on 6 meters. Two years later she has over 400 contacts and 47 states on 6 meters.

Have fun,

John

I have a Ranger 5054, but recently got a used Kenwood TR-9130, and old but adequate 2m all-mode rig ($175USd). There are a few 2m all-modes out there. I was also tempted by the TT 6n2, but it is a bit too pricey, and is more of a base rig.

Subject: [6 Meter Sked] Starting in 6 meters with Tech

Just last week I received my Tech license, and although I hope to upgrade to a General license, my work schedule right now precludes even attempting to start learning CW for at least the next 6 months. That leaves me largely with 2m and 6m to play on for the near future, and I would like to try my hand at DX with SSB.

The problem is cost (like with most people). If only the cost of an ICOM 706MKIIG was half the price! I have been looking at the Ranger 5054DX-100 and the Ten-Tec 526 6N2 as alternative beginning radios. The price of the Ranger is affordable, but it does not cover 2m. The Ten-Tec covers both 6m and 2m with SSB, but the cost is a good bit higher. One option was to get the Ranger (low price for 6m multi-mode) and get a nice dual band HT with a few accessories to use in the shack as well as the office and truck.

I want to operate from home and mobile in my truck on long trips (not everyday driving), so will need both a mobile and base antenna (unless somebody has a suggestion for one antenna for both purposes), and a power supply. Of course, the transceiver, too.

Any suggestions, advice, help, comments for a newbie would be appreciated. Have been reading some of the previous messages and learning alot. Glad I found this group.

Andrew,

I cant offer much of a comparison. I am new to 6 meters. I've had a tentec xverter in the closet for years and finally decided to get it going. I started with a dipole at 12 ft. Didnt hear or work much. I started looking around at directional antennas. The reason I selected the Moxon was for one, price. $75. The other big reason was visual impact. I dont have a tower. I use masts. The one mast I have is pretty full and itlooks bad enough. I have a temporary installation on the moxon for now. I bought to 11ft fence rails. I mounted this to an upright on my deck. put a cheap TV rotor on it. from the street, all you really see it the rotor. I have no restrictions here, I just try to keep my property looking as nice as possible. Because of the horizontal orientation of the moxon, you really cant see it at all. Very light weight also. Get this...I have the mast duct taped to the deck. lol I'm going to change that this weeknd, but it's holding up just fine.

Performance, well compared to the dipole, it's night and day. I was able to work a few aurora qsos from southern Pa with 8 watts. I think for the size, weight and price it is the best deal going. Also, very easy assembly and without any tuning, it was dead on for ssb and cw. seams to have a fairly good bandwidth also. I think I was still reasonable up in the FM portion. Cant wait to get it up to 40ft.

I have a Midland Syntech I (70-050C) running on 6M, with an annoying problem.

It will not transmit until the carrier drops from the repeater.

Is this something that can be changed in the radio, or does it require reprogramming?

3837. Re: [6 Meter Sked] Midland Syntech I's

Yahoo group: 6meter (2000 — 2003)
Date: 2003-10-30 16:56:46 UTC
From: Christopher Boone
Topic: 3836 Message: 3837

Yep...there is a setting called BCLO (Busy Channel Lock Out)...probably got set to YES in programming.....needs to be set to NO.....then you can key the radio at any time.....BCLO is a nice idea in theory.....(but has its drawbacks if the rptr has a LONG hangtime...of course in COMMERCIAL community rptr usage, the operation is slightly different and thus BCLO was a good idea).....It is all done in the micro so there is nothing you can do in the radio itself...if you need the EPROM reprogrammed, I can do it.

I hope others on the reflector had more luck than me over the last 2 days with the Aurora. During the limited time I had to listen (listening right now), all I worked was 2 local stations - never heard any other signals 6m/2m/70cm. :(

I even went outside to try to see the northern lights, but I think the trees are too high!

Six was open last night (barely in FN65), heard a few weak signals, managed only one QSO to EN-44, But buddies in same area worked a couple including VP9GE (Bermuda),I heard a Ox3 station on CW, but he was very weak, I think it was the same station I worked on phone this summer (OX3SA), First time I heard Aurora propagation, ERIE Sounding, I'm still on the vertical, but hope to have the 5el homebrew beam up in the next 2-3 weeks in time for Dec & Jan Es, if there is any. How often does 6 open in Dec & Jan, this is my first year on 6, had a great July, but havn't been through the Dec-Jan season, and don't know what to expect.

AU was hot last night from 0:00 UTC to 1:30 UTC in EN63 on 6M SSB. Worked many grids around my area that are just to close for E DX. Even picked up 2 new states. I could even hear both side of the conversation many times.

Right when the AU DX dropped off, very strong E DX came in from Eastern Canada (Quebec, New Brunswick, Nova Scotia). Worked a few more grids there, and even picked up a new Canadian Providence. Everything went completely dead at 2:15 UTC. I listened for a few more hours, but heard nothing more.

The AU is quite difficult, as it sounds like the person is under water. It also wasn't always on 50.125. If you scanned the band from 50.125 to 50.200, there were pockets of AU DX (Mostly 50.125 to 50.165). Most of the time, signals were only S1 or S2, but a couple of times it went as high as S5. I have a 6M pre-amp, plus have the audio running through a DSP into an audio amp and nice speakers, which helps considerably.

My wife was about ready to kill me, as she could hear all the audio upstairs all night long.....

I listened a little to 2M SSB, but never heard a peep.

Wade.....

I'm with you! I've had a 6-meter plug-in for my Yaesu 767 for about a month. I've never heard anything resembling a QSO on 6! I am in South Florida and I have a dipole about 10 feet off the ground.

So far: 6 meters = NOTHING!

I want to know when the "magic" begins.

6 meters is the "poor man's" HF. For those of us that are Techs, this is as close to DXing that we can get. Occasionally it'll be great but most of the time it's dead. I've worked all of the UK and several European countries with a 3 element yagi only a few feet off of the roof. My farthest confirmed contact is with the Galapagos Islands with my farthest actual contact being in france (see my webpage). If I ever upgrade, I'll be abandoning VHF/UHF completly with the exception of an occasional 2m or 70cm repeater contact. Of course, I'll probably have to change my email address! :)

I suppose that's one way to look at it. It's certianly a challenge to keep your sanity, listening to hissing for hours on end without a signal and then on rare occasion, hearing the band open just like HF on any given day.

There was Aurora in NB Canada FN65, last night and again tonight,I
managed to work en-44 last night, but the signals were very low
here, saw the northern lights tonight, but was working and six died
out before I got home, another Ham 0n 6 told me sigs were very low
again tonight. after aurora died out last night Es came in a little.
Oh well Hopefully some more Es in Dec-Jan
Kent

I like variety. When I get tired of 6m. I'll take a break and go to HF.
My mode use is about the same. I'll work phone for a few months, then
hook up the keyer and work nothing but CW for a few months. Thats the
nice thing about ham radio, so many choices...so little time.

I'm sure that's true, considering that it's important to reduce loss anywhere you can with VHF/UHF. I intend on getting a multiband vertical for the roof as my only HF antenna if I every upgrade. The 6m and 2m/70cm yagi's will come down.

Part in parcel to the Magic Band is luck. Tonight all I had in was HI. Night before I worked my first SA stations. Who knows maybe tomorrow night you'll have all sorts of signals and I'll be listening to static. Timing is also a factor. The band has been pretty well dead in the US since Sept. 1st until the recent openings. A few TEP openings (especially in S. Fla) but for the rest of us NADA. It'll get better. It always does. Another factor is a marginal antenna (no gain) 10 feet off the ground. Put the dipole up 20 feet and I'll bet you start hearing something. Put even a small beam antenna up 30 or 40 feet and you'll be amazed at what you'll hear and work. The magic begins the first time those far away voices come across the radio and you work them. It'll happen.

The band finally opened for me in DN23, worked TG9NX in Guatemala earlier this afternoon. It worked out fantastic, I had just changed the direction of my wire dipole, turned on the radio and there he was. Was fading in and out a lot but we had just enough to acknowledge each other. Magic band is right!!

Hang in there! I am also in South Florida (Dade County) with a copper pipe j-pole for an antenna. I managed to contact Argentina on 6 once (actually twice, and two contacts in some other south american country near Argentina - all on the same day).

-- James KF4OUI

I'm with you! I've had a 6-meter plug-in for my Yaesu 767 for about
a month. I've never heard anything resembling a QSO on 6! I am in
South Florida and I have a dipole about 10 feet off the ground.

I've got the Ranger 5054, hooked up to a dipole maybe 7 feet off the ground. While I've heard a couple people (as it happens, from my local area) over the time I've had the station running, I've yet to get anyone to hear me.

I'm beginning to get paranoid that there's something wrong with my mic. What sort of tests can I perform to set my mind at ease about my microphone?

With 6 meters being VHF a dipole is not going to do much of a job especially 7 foot off the ground. To do a decent but not great job you at least need a 3 element beam mounted horizontal. I would figure that to be the smallest antenna to make reliable contacts.

Easy. Do you have another receiver that covers 6 meters? If you do not have one then another ham in your area is bound to have an old radio shack scanner. If you can hear yourself over the scanner the mic works.

My theory is that your mic works, but nobody can hear you because the dipole is too low.

Not necessarily true. I have a dipole cut for the low end of 6 -
mounted up about 25-30 feet horizontally. I am in FM-18 and can
routinely work up to the NYC area and have had contacts out as far as
Colorado and Newfoundland.

May not cut through the pile ups, or get a loud signal out when the band
isn't open, but it does a wonderful job when the band is open. I have
been more than pleased with it.

Having said that a beam is on my wish list for some time in the future
for those occasions I mentioned that I have problems with above. The
comments are more in relation to the comment "a dipole is not going to
do much of a job:.

I'm assuming you have an SWR or power meter inline. On SSB you should be able to see noticable variations in the deflectionof the meter if your mic is working.

This won't tell you the quality of the audio, but it will prove that audio is making it into the radio, modulating, and making an SSB signal.

Also I agree on the antenna. I never had good luck with dipoles on 6M. I built the halo designed by KB1DIG
http://home.comcast.net/~buck0/6m_halo.htm
I put it up and within minutes worked TX. Only minutes before I had my dipole and didn't hear anything.

With the 5054, as long as the bar at the bottom of the display is moving, preferably as much as full scale as possible, then you're good. The stock mic isn't great, so you'll have to talk pretty close. I'd recommend either an Astatic 575M6 or a D-104 mic. They are great mics for that radio.

Don't worry about no contacts. I haven't made a 6m contact since July and I have a 3 element yagi at almost 30 feet with 100 watts.

From: hotwing_rider
Topic: 3870 Message: 3870

For those of us whom are completely illiterate to 6m operations and the different types of band openings, I have a rather stupid question for those elite 6m operators. In recent days during what I perceived to be aurora openings, the signals I was hearing seemed to have a warbled sound. The sort of audio heard during HF communication via long path operation. To explain further, I live 30 miles south of Indianapolis Indiana. The stations I was hearing was in Kentucky or to the south of me. Adding to my confusion, I was required to point my beam to the north to hear them. When directing the antenna towards the stations I was hearing, I completely lost contact. Station arrangement is a RCI 5054DX100, MFJ906 tuner, 5el Comet beam positioned above a Tennady LP both mounted on tower 50 high.

Back to my question... Is the phenomenon described above with reverse antenna direction and warbled audio normal during aurora communication?

Confused,
N9BYY / EM69
Dan

Get the antenna up higher. The higher the better. I don't do a whole lot of 6M since I do not have a beam but the GP-15 at 35 ft and 10 watts got Texas and Mexico on FM and SSB from EN72 in South West Michigan. The antenna is now at 70 ft and I plan on putting together a beam for the CW and SSB contacts. Don't give up hope. Last night heard some good aurora on CW 1,3, and 4 land before I had to go to work. I hate 3rd shift.

I've been trying to work 6 on < 10 watts since June.
I got a real...as in made for 6m antenna back in August....but it is a vertical.
Made my first and only contact last week.

I am working out the bugs on my homebrew moxon before I put it up.

I hear stuff but I am not able to break through to make contacts.

I may just have to finish my 3 el beam and point it North and be happy with it for the time being since I have no rotator. I could put it at 18' and go outside and turn it by hand.......but that would put it at the same level as some power lines and I'm not sure it that would hamper things at all.

Keep trying....it'll happen. I just wish it would happen more often for me but until I get a horizontal up I don't expect it to improve much for me.

73,
Jon

Yes the signals are being reflected off the ionized particles of the upper atmosphere at the magnetic poles that were charged by the effects of the latest solar flare. The warble is caused because of the way the RF signal scatters off of those charged particles. You get the same effect off of the trail of a meteor. If you have a DVD player rent frequency and watch the special features section. Very informative about the effects of aurora and has some good information on the sun and the sun spot cycle.

Aurora
IS not like anything else in amateur radio!
The sound is a product of the "reflective screen" that the Northern Lights produces. A simple explanation would be the "twisting" of the signal polarization.
Polarization is the reason for the aurora.
It can be there all the time, just not as strong as when stimulated by coronal injections.

The second part of your question, as to pointing north; that is where the reflective screen
is located, at the north pole. If you lived in the southern hemisphere, you would point
your beam south. The distortion sounds the same at either pole.
The further north of the 45 th parallel, the more common the occurrence of Northern lights (the visual evidence of Aurora). Usually during the late summer, when the pole is pointed at the sun. Remember it is a magnetic phenomenon

Thanks to everyone for their helpful hints. Remember me - I am in Miami, FL with a dipole 10 feet up and have not heard a thing on 6-meters in a month of listening.

From all your thoughts I get the impression the antenna is the problem. Unfortunately, I do not have unlimited funds or unlimited space available (plus I have neighbors who don't like big yagis, etc.).

So here are my likely available options. Please: your opinion on which road to take. BTW - I have a flat roof - the antenna would be mounted next to the roof and not more than, say, 5 feet above the roof line.

1. Dipole up higher - (obviuosly easiest & cheapest)
2. Omni Halo
3. Moxon
4. Ground plane vertical
5. Something else?

Thanks in advance for any and all opinions!

Peter....
I have 2 lines of thinking here.....
If you are going to be working SSB and/or CW I would consider the Moxon or the halo. The former has directable gain and can be turned with a small rotator if desired. The halo is omni and horizontaly polorized. That can be stacked for gain....not sure how much gain you would get.

If you goal is FM then the vertical is your best bet.

I have heard things on my vertical but with low power I can't get out, although I have made one contact with it. My liner amp has no preamp and makes my receiver deaf if I want to push 50 watts (100 p.e.p.). So far it hasn't helped.

The moxon and halo are fairly low profile and don't stick up.

Of course the best of both worlds would be a moxon and a vertical (ground plane or half wave) on the same mast so you can switch back and forth as desired. A 1/4 wave ground plane might have a more desirable take off angle for propagation and DX work that a half wave.....

Hope this helps......

You've just been listening for a bad month, and you're too far south for the Aurora openings.

I've got 22 states, and 100+ grid squares this summer/fall from a 1/4 wave 6M vertical ground plane or from the mobile using a 2M 5/8ths wave whip.

6M is kind of a right place, right time band.

From Miami you should be able to get some band openings that are impossible farther north. For instance there were some Africa openings this summer, but only for people on the east coast and farther south.

The best time for 6M for me is June/July, and this summer was fantastic. I have zero contacts in September, and if not for the Aurora the last few nights I would have had none in October too.

Give us a few more details:

What frequencies/modes are you monitoring?
Is you dipole vertical or horizontal?
Can you check SWR?
What kind of coax are you running, how far?
What radio are you using?
How many watts?
Are you trying to use a squelch?

>
> Don't worry about no contacts. I haven't made a 6m contact since July
> and I have a 3 element yagi at almost 30 feet with 100 watts.

Hmmmmmm. The bar doesn't move! I wonder if I should contact Ranger,
or just buy a new mic. Are they inexpensive?

-Ray

If the bar isn't moving when you're talking on SSB, then you're not putting any power out. On FM, it will be on steady. Do you have the radio hooked up to a power meter? Do you have the variable power turned all the way up?

The Astatic 575M6 or a D-104 mic's may run you between $25 - $75, depending on new or used. Also, do as someone else suggested. Get a scanner and tune it to the frequency you are transmitting on. You can set the 5054 to FM to test the audio there, then switch to SSB. You obviously will hear garbled audio on the scanner when you're transmitting on SSB, but at least you'll know it's working.

http://autoinfo.smartlink.net/kq6rh/antenna/cubic_qu.htm

This page has info on cubic quads that may be an option for you.
You could mount it with a hinge at the mast to change polarization so as to work CW/SSB and also FM.
Push up mast and rotate it by hand then drop it down when not operating to not annoy those pesky neighbors.

Peter, although a big antenna is desirable, you can work 6meters with a dipole, you will simply not be able to work the marginal openings. In July this year I worked over 200 stations and collected 77 grids mostly USA, but I did work Bermuda, France,and Greenland. All on a MFJ-1798 multiband vertical.its not ideal, and I've built a 5el beam that I hope to have up soon that should make a differance.My rig is an Alinco DX70th with 100 watts on 6M. One of my buddies had almost as good luck with a dipole on 6. So it is possible, you just have to be patient and wait for a good opening. It only takes one good Es opening to get Hooked on 6M. I have another buddy that works CW on 6M, and has worked a lot of DX, he uses an indoor dipole!!!I've only made 1 contact since July, and that was Wed night, but expect it to get better near the end of the year.

Luck IS part of it....heck I heard the HC beacon yesterday at my house on my simple CP antenna (cross dipoles;
H & V) at about a S4-5.....nothing else....didnot hear HI here at all! :(

Oh well.....that's the magic band....sometimes it is...and other times it's not.
But when it is, it's great!

Subject: Re: [6 Meter Sked] 50mhz Hawaii WOW!....NOT!!

Part in parcel to the Magic Band is luck. Tonight all I had in was HI. Night before I worked my first SA stations. Who knows maybe tomorrow night you'll have all sorts of signals and I'll be listening to static. Timing is also a factor. The band has been pretty well dead in the US since Sept. 1st until the recent openings. A few TEP openings (especially in S. Fla) but for the rest of us NADA. It'll get better. It always does. Another factor is a marginal antenna (no gain) 10 feet off the ground. Put the dipole up 20 feet and I'll bet you start hearing something. Put even a small beam antenna up 30 or 40 feet and you'll be amazed at what you'll hear and work. The magic begins the first time those far away voices come across the radio and you work them. It'll happen.

Thanks Keith for your help. And thanks to everyone else who has offered me suggestions - MUCH appreciated!

Keith, you asked a few questions (see below). My answers:

1. Monitor 50.125 and scan 50.1 - 50.3 Upper Sideband (I have also listened occasionally to the repeater output frequencies(52.5 - 52.98) on FM. I have not heard a thing!
2. My dipole is horizontal (10 feet up - I am going to try to get it up higher this weekend)
3. Haven't checked SWR yet - I have a friend who will lend me a meter someday soon.
4. Coax RG-58, about 20 feet
5. Radio Yaesu 767 w/6-meter plug-in (have had much success with this rig on 20 & 17 meters also using dipoles 10 feet up)
6. 10 watts
7. not using squelch

Hope this helps! 73 Peter KI4BYE

> Give us a few more details:

Topic: 3863 Message: 3886

Turn the mic gain ALL the way down......turn off any processor that may be on (I cannot recall if the
Ranger has one or not)....then KEY the radio.....while keyed, whistle into the mic at a steady tone (around 1000Hz or whatever you can do)....turn UP the mic gain while watching the POWER OUTPUT on the meter...when the power
out PEAKS and will go no farther, leave the MIC GAIN at that setting...turn on the processor if present..
you could turn your TV to channel 2 and watch the screen go wacky when you key up and talk into the mic..
OR
Try putting the radio in FM mode and see if you can hear yourself on the TV2 OR
listen on second harmonic on the FM band (50.15 x 2 = 100.3 FM) your audio will sound weak compared to
FM stations but that IS normal (FM broadcast uses 75 kHz deviation...your normal 5 kHz is doubled on the harmonic but its still only 10 kHz!)

Either way should verify the mic is ok...

Subject: [6 Meter Sked] microphone paranoia

I've got the Ranger 5054, hooked up to a dipole maybe 7 feet off the ground.
While I've heard a couple people (as it happens, from my local area) over the
time I've had the station running, I've yet to get anyone to hear me.

I'm beginning to get paranoid that there's something wrong with my mic.
What sort of tests can I perform to set my mind at ease about my
microphone?

-Ray

Date: 2003-10-31 17:59:17 UTC
From: Christopher Boone
Topic: 3877 Message: 3887

Peter,
a couple of comments on below:
1) listen to the auto beacon band as well (50.06-50.08 and you may want to go lower as well! you may hear the band open with a beacon but noone live is on! that was the case yesterday with the Quito Ecuador beacon heard in Texas on 50.034.5 but nooone was on the band!) Remember the FM simplex is 52.525 and MOST rptrs are
on ODD channels out (x1,x3,x5,x7,x9) up to 53.99 MHz, not 52! Those areas on the oddball 500 kHz even channel plan are fewer in number...check the rptr directory for maybe a close by listing to you...but for best performance on local FM, you want a vertical.

2) Yes, get the antenna as HIGH as you can and keep it in a horiz plane as much as possible....but also remember a dipole is a figure 8 pattern...if someone is off the ENDS of the dipoles, they are in a null for you...and you may not hear them..(when the band opens, that may not be totally true but still)....you might want to think about a halo, fullwave horiz loop, turnstyle, etc! OR bend the dipole elements BACK (in the HORIZ plane) into a Horiz V for more omni coverage

3) SWR is probably not an issue here...if your dipole is cut close enough it should no be a problem

4) 50 Mhz is starting to be VHF...forget RG58 if you can and go with 8 or anything bigger...

5) dipoles on HF will get out via skywave ok...but on 6 you are looking at more groundwave when the band is NOT open...and thus you cannot compare HF to 6..

6) I run a TS680 which is normally 10 watts....I did get it up to 25 watts (the brick can handle it....you COULD possibly do it in the Yaesu...it likely has the same brick module...but you only will get 3db or so increase...
about half an S unit...)

7) If your squelch is allmode, use it...try to set it to minimum setting...makes scanning and long time monitoring a pleasure.....you eventually will suffer fatigue listening to unsquelched noise all day..

From: James Carlin
Topic: 3877 Message: 3891

If you were me, I would go for mounting the dipole as far above the roof as I could. You already have the dipole, so you have nothing to loose by moving it to the roof. You would not have to buy anything else and you could make the move this weekend.

Once you get going on 6 meters, you can investigate the possibility of a better antenna.

One more thing - if you live in a non deed restricted neighborhood (in otherwords, no pesky homeowner association) forget about your neighbors. As far as Dade County is concerned antennas do not violate any building code. No permit is needed, not even for a tower. Yea, the neighbors might say something to you about antennas, but when they want to have a party that lasts to 1 AM they think that is OK. When they want to install security lights that shine directly into your windows that is OK. After a while they will get used to your antennas, then everything will be ok. None of my neighbors have ever complained about any of my antennas. If you are polite and explain what you use the antennas for, most people understand. The most important thing is communicating your needs in a polite manner.

Another thing. The South Florida FM Association meets on the SECOND Monday of every month at 9400 NW 41st street at 7:30 PM. This location happens to be the headquarters of the Miami-Dade County Fire Department and Emergency Management Office. All meetings are open to the general public. Drive around to the back of the building, park in any unmarked space. Tell the guard at the back door you are there for the SFFMA meeting (or radio meeting, he will know what your talking about). Bring a photo ID to swap with the guard for a visitor pass.

The web page for the SFFMA is www.sffma.net go there to verify the address

One more thing, you might want to join the south FL hams email list. Go to groups.yahoo.com and search for SOFLAHAMS. This email list is also open to all hams, not just people in South Florida! If anyone else on this list is planning on visiting South Florida, this list is an excellent place to get local information such as active repeaters and things.

-- James KF4OUI

1. Dipole up higher - (obviuosly easiest & cheapest)
2. Omni Halo
3. Moxon
4. Ground plane vertical
5. Something else?

Mines made with 1/2" copper tubing and yes it is.
I just got it up in the air at about 22' and the mainthing I have is noise
as it points to the NNW and directly as some power lines.
I can't put up a rotator yet so that direction will have to do.
I set is up so that I can switch back and forth between it and the ringo and
check signal strengths for comparison purposes.

I'll keep you updated as I go along.

From: Ray Crane
Topic: 3843 Message: 3896

According to Andy Cogswell:
> With the 5054, as long as the bar at the bottom of the display is
> moving, preferably as much as full scale as possible, then you're good.
> The stock mic isn't great, so you'll have to talk pretty close. I'd
> recommend either an Astatic 575M6 or a D-104 mic. They are great mics
> for that radio.

Oh, another thing that makes me question my mic... I flipped over to
that oh-so-useful "PA" mode, keyed, spoke, nothing. Am I correct in
assuming that I ought to hear myself out of the speaker in "PA" mode?

I opened up the mic and didn't see anything obviously disconnected or
loose. I *hope* its the mic and not something in the transceiver itself.

Do you figure it'd drive one side of a standard set of headphones?

Could be.....only way to find out is put RF into it and make contacts :) If it was 1:1 at all freqs, I would begin to worry....my crossdipoles at 30 ft is wideband.....good at the high end and around midband the SWR climbs a little and then settles back down in the SSB portion...

Remember, a Moxon is horiz....not good on FM.....where vertical is king.. but as long as it covers 50-50.8, you're set....

Look for you on the band!

>
> Do you figure it'd drive one side of a standard set of headphones?

The answer to that, by experimentation, seems to be yes.

So, perhaps the mic is fine.

However, the interesting thing is that the Mic Gain adjustment
seems to have absolutely no effect in PA mode. Also, I can get the
slightest hint of movement on the SWR/Power meter and a corresponding
1-segment blip on the transceiver's builtin meter if and only if I
turn the Mic Gain knob all the way to the max.

I wonder if the Mic Gain knob is somehow miscalibrated.

is this a new radio? if so just take it back and get another
as for the mic gain i dont believe it would work in PA mode any way the
mic audio is usually fixed on stuff like that

> is this a new radio? if so just take it back and get another
> as for the mic gain i dont believe it would work in PA mode any way the
> mic audio is usually fixed on stuff like that

Well, it was new when I bought it several weeks back. I had no reason to suspect any problem at the time, since I was still getting my antenna situation settled and acquiring a SWR meter, etc. Then, I was too busy to turn it on for a while, and now here I am.

I can give Ranger a call, but it looks like they don't support hours on the weekend. :(

Ahh, to talk to SSB users locally and non DX wise, it better be!
Otherwise you have a 20+db (100:1 in power) LOSS of signal strength..

To quote from W4RNL's web site (all rights reserved):
http://www.cebik.com/6m.html (emphasis added below is mine)....

"Hence, for full band coverage--or for selected use of one or the other
MODE of activity--we really need 2 Moxons.
----> The first will be horizontally oriented beam designed for 50.5 MHz
with coverage of the first MHz of the band.
The second will be a vertically oriented version designed for 53 MHz,
with coverage from 52 to 54 MHz. <----
After looking at the characteristics of these two versions of the same
basic design, we shall make a few construction suggestions. Finally, we
shall show how to combine them into a single array--BUT with SEPARATE
feedlines. "

Now, he doesn't feed them with a single coax...you could like a cross
dipole yagi IF they were cut to the same range BUT to get the correct
polarization in that case (circular or CP in this case)and most usuable
radiation of them, you MUST add 90 degrees of phase shift between one
antenna feed point and the other..otherwise you end up with a screwy
pattern (CP is done all the time on FM broadcast antennas)...but since
the antennas will be covering different ranges, he correctly uses
different feeds....

From: JJ
Topic: 3877 Message: 3905

Ahhh yes...and you put it so much better than I do.

The point was that properly cut a moxon could be utilized in a vertical
polorization application.
If you have the need for a horizontal as well you can benefit by building
together and having one mount point on the tower.
Phasing them brings up some interesting possibilities....especially if you
can switch betweenthem for best signal.

The lively and enjoyable discussion continues...

The moxon radiates great. Filled the logbook last night with 8 watts. I was surprised that it seems to cover the entire band, although wont do me much good up top. I'm very pleased with the antenna. Works great. Will hold me till I figure out what and how I want for the next one.

hey mark
just remember a dummy load is a 1.1:1 SWR too just doesnt radiate for beans,,,grin

Sounds good Jon. I had mine at 22' also. Used 2 fence rails. I added another 8' today. I'm not sure I'm going to keep that arrangement. doesnt seem too stable, but it will do for a week or so. I'm using a TV rotor. Works fine. I worked quite a few aurora contacts last night and the night before. I also put new feedline on today. Was using cheap RS junk cable till today. I've got the new height and the new feedline and now the band is totally dead. Oh well... It'll come back around. I am hearing a beacon about 100 miles away that I didnt hear before. So I guess we're doing better. I've only got 8 watts, I'll have to look for a brick over the winter. Keep in touch on the antenna project.

Mines made with 1/2" copper tubing and yes it is.
I just got it up in the air at about 22' and the mainthing I have is noise
as it points to the NNW and directly as some power lines.
I can't put up a rotator yet so that direction will have to do.
I set is up so that I can switch back and forth between it and the ringo and
check signal strengths for comparison purposes.

I'll keep you updated as I go along.

3909. Re: [6 Meter Sked] Lively Discussion

Yahoo group: 6meter (2000 — 2003)
Date: 2003-11-01 04:29:13 UTC
From: JJ
Topic: 3877 Message: 3909

It is dead tonight.....must be all the ghosts and goblins out and about. HI
Hi
I haven't heard any beacons yet....on either.

Mines stable....just can't turn it without climbing onto the roof....not a
fun thing at night.
My ic-505says 10 watts with external power....I think it's closer to 5 - 8.
Oh well....a hamfest special that works and got me my first dx contact, 6m
contact, grid square all at once.

If I had the spot I'd put it on it's own 36' push up pole with a rotator on
it and the ringo on top of that.

73,
Jon
KD5SFA

http://www.cebik.com/6m.html - moxon rectangles for 6
http://www.cebik.com/moxgen.html
http://www.cebik.com/moxpage.html a page that links to many other pages on Moxon's

The moxon Antenna project - mainly HF
http://campus.murraystate.edu/org/msuarc/moxon/index.htm
one guy on this site has a variation I will build this coming week...it has me rather excited.
his info is located here.... http://www.hamuniverse.com/17mcoaxmox.html

http://www.cebik.com/4.html a tale of 4 beams...good article...you'll se elements of this in the previous link.

Have fun and enjoy. Cebik has much info....not to mention the math to back it up.
It makes my head hurt at times but I get over it.

3912. RE: [6 Meter Sked] Lively Discussion

Yahoo group: 6meter (2000 — 2003)
Date: 2003-11-01 04:48:36 UTC
From: M. Walton
Topic: 3877 Message: 3912

Thats probably what I'll end up doing. I've got a 30ft pushup that got damaged in the storm. I've got my HF wire on that and the ringo on top. I'll have to see if I can squeeze the Moxon, an 11ele 2m yagi, my 80 meter dipole and the ringo on one mast. Thats a project for another day. My fencerail mast was good and stable till I added the extra 8 ft. It's not UNstable, just not as solid as I'd like to see. I'll work on it some more and see what I can do.

Mark

3914. Re: [6 Meter Sked] microphone paranoia

Yahoo group: 6meter (2000 — 2003)
Date: 2003-11-01 04:59:35 UTC
From: Barry_bogart
Topic: 3863 Message: 3914

My dipole went from the house eaves to the top of the garage roof - maybe 10' up. I worked all corners of the States from CN89 like that, on 10w SSB. I am afraid I haven't done any better with 30w into a beam (so far!).

Not necessarily true. I have a dipole cut for the low end of 6 -
mounted up about 25-30 feet horizontally. I am in FM-18 and can
routinely work up to the NYC area and have had contacts out as far as
Colorado and Newfoundland.

With 6 meters being VHF a dipole is not going to do much of a job
especially 7 foot off the ground. To do a decent but not great job you
at least need a 3 element beam mounted horizontal. I would figure that
to be the smallest antenna to make reliable contacts.

73 and Good DXing,
Jamie R. Dean - W4JRD

3916. Ranger SWR question

Yahoo group: 6meter (2000 — 2003)
Date: 2003-11-01 05:31:06 UTC
From: Barry_bogart
Topic: 3916 Message: 3916

Speaking of the 5054, now my built-in SWR bargraph disagrees with my MFJ 906 tuner/cross-needle meter. I have an MFJ 3-elem beam. When the tuner shows minimum SWR (close to 1), the 5054 shows all the bars; When I minimize the bars (3 is the least I can do), the meter shows 1:2.5. So my question is, should I believe the Ranger of the tuner?

With the 5054, as long as the bar at the bottom of the display is moving, preferably as much as full scale as possible, then you're good. The stock mic isn't great, so you'll have to talk pretty close. I'd recommend either an Astatic 575M6 or a D-104 mic. They are great mics for that radio.

Peter

I also live in south florida,homestead,your equipmemt is fine ,i"ll try to help you out here, for us here may-aug.will be your e-skip season and sept-oct.it will get kinda dead,but in sept-oct.you want to listen for the central and so. american stations,I have worked many lu,lw,ce and ys and ti's and on the 30th of oct. I worked hawaii bk29 from here, we also have a tep season,it can be very fun at times and very dead for periods of time but hang in there,this winter it should pick back up,I used a 10-80 ground mounted vertical when I first got started and made alot of contacts with it,now running a beam,di-poles work fine to, just get it up,20ft. if you can or higher,I suggest you listen for the beacons and listen around 20:00-00:00utc. and even latter in the evennings,around 50.110-50.125 right now its kinda dead, if you would like some help I go to the everglades radio club,and throw a cq on 125 now and then you never know,

3928. Re: Ranger SWR question

Yahoo group: 6meter (2000 — 2003)
Date: 2003-11-02 01:55:43 UTC
From: vinnievision
Topic: 3916 Message: 3928

I believe the Ranger may have a peculiar SWR factor in the radio itself.
I have just acquired a used Ranger 5054DX (25 watt version) and I found that when I hooked it up to my M2 6M Halo, it matched SWR perfectly. Only problem is that both my Icom 706 and Icom 746 needed an adjustment through my MFJ 906. My Ranger does not agree with any of my radios and antennas -- it is always the "odd radio out" when it comes to the SWR reading. The MFJ-906 agrees perfectly with both Icoms. I recently connected the Ranger to a Teletek 180 6M amp, and the SWR from the radio to the amp was 1:2.0 (according to the radio meter and the MFJ 906), no matter what I did.
I begining to think after reading the post-- that the Ranger not be looking for standard 50 ohm load.

Vinnie/KC2KXV

3930. 6 Meter Antenna

Yahoo group: 6meter (2000 — 2003)
Date: 2003-11-02 04:30:51 UTC
From: Rita
Topic: 3930 Message: 3930

Greetings:

As I am comming back to amateur radio after a 8 year sabbatical, I need an opinion about a potential 6M antenna. Since I live in a condo where outside antennas are prohibited, I was thinking about using an existing awning frame (which is attached to the exterior of the building) for a possible 6M antenna.

It is located between the 2nd and 3rd story, about 15 feet above ground. Dimensions are like a rectangle missing the fourth side. Measurements are 40 inches each for the short sides, 80 inches for the long side.

The rig I am using is a Yaesu FT 8900, 6M is FM only.

Would an antenna tuner help my situation?

Thanks in advance for your opinions.

3931. Re: [6 Meter Sked] 6 Meter Antenna

Yahoo group: 6meter (2000 — 2003)
Date: 2003-11-02 04:59:48 UTC
From: James Carlin
Topic: 3931 Message: 3931

An antenna tuner would absolutly help. It is very unlikely your awning antenna is a 50 ohm load, and even if it were who knows if it would give good SWRs on 6 meters. With a good tuner, there is a good chance you can match the antenna to the radio without damaging anything. My tuner is a MFJ-969. This tuner has a roller inductor (as opposed to an inductor that has preset solder points). This model also covers HF plus 6 meters, and has a power rating of 300 watts.

Remember that you really need a ground for the tuner. Living in an apartment you might have to get creative. Running a traditional ground rod will not work because you are not on the ground floor. Maybe you can ground to a water pipe???

From: Christopher Boone
Topic: 3930 Message: 3932

If you are going to be doing 6 FM only and not SSB, you need to worry about anything exotic...a simple vertical will work fine....you could try a 2mtr 5/8wave Larsen or equiv on a MagMount so you can put it outside when you want to operate (if you have a metallic place to stick it to) and take it in when you are through....anything outside is better since you typically see a 12db loss min. with an indoor antenna....

I use a NMO150B on 6...works fine across the FM part...and of course it also works on 2mtrs ok!
The B is the black version...can barely see it and viewed from ground would probably be unnoticed...

3934. MFJ 9406 mobile and igntion noise

Yahoo group: 6meter (2000 — 2003)
Date: 2003-11-03 03:34:15 UTC
From: Bruce H. McIntosh
Topic: 3934 Message: 3934

Second attempt to post this... first one I sent to the wrong durn maillist :-)...

Subject says nearly all. I'm trying out my MFJ 9406 mobile (heavy power lines direct to battery) and naturally, the ignition noise is ferocious. The vehicle's a 1989 Mercury Sable wagon. Note that I hear not one lick of ignition noise in the stereo, nor in either the Yaesu 2500 2m rig nor the FT-100 that I sometimes have on the seat next to me, just in the MFJ.

Has anyone else tried using this radio mobile? Any suggestions on noise-proofing the rig - some sort of filter on the power feed, better grounding, encasing the whole radio in mu-metal? :-)

And a late update... I hooked the MFJ up to a 7AH sealed battery and then fired up the wagon and drove around - lo and behold no ignition noise. Looks like the power supply filter idea is the way to go.

3935. 6M CW transmiiter

Yahoo group: 6meter (2000 — 2003)
Date: 2003-11-03 03:46:27 UTC
From: Brian McClure
Topic: 3935 Message: 3935

I'm looking for either a kit or schematics for a QRP CW transmitter for
6 Meters
Receive capability is not necessary.

Ideal would be 5-10 watts out but I'll take what I can get

Thanks

Brian

Topic: 3934 Message: 3936

Auto electrical systems have some suppression in them but they are effective at only certain ranges (usually just AM and FM broadcast)...other freqs, the filtering is NOT effective. There are two ways for noise to reach a radio...."conducted" via the power leads or "radiated"-picked up via the antenna.
A FM radio like your 2500 usually doesnt hear radiated noise until it gets BAD because of the limiters in the IF chain which eliminate AM components (which "noise" consists of!)...conducted noise MAY or may not show up depending on severity...

Of course, it is best to get rid of the noise at the source...the Ft100 probably has better filtering in its leads to reduce the problem and there is also the Noise Blanker in the rcvr which helps..

Using another power source (the extra battery) eliminated conducted noise...had you heard the noise, it would be radiated which would require much shielding on the ignition system to reduce radiation..

Going to the battery is a good way to reduce conducted noise as the battery acts as a large capacitor/filter.....but make sure all other metal to metal connections are good (hood to chassis bond, engine to frame bond, etc)....Better grounding is always helpful...but if this noise is coming from an electronic ignition system, it may require a module change out....which can be costly :(

Yup....only way I could use mine. I've snagged quite a few grids mobile with the MFJ but hooking it to the auto power system totally overloaded the rig w/hash. Running it off battery (5aH gelcel strapped to the bottom) allows me a portable rig which I can also toss onto the bike when I'm wandering thru the mountains. Simple dipole and a small collapsible pole allows me to stop and set up a station wherever I wish. I charge the gelcel off the auto power system when not running the rig.

'Course, the MFJ isn't what you'd consider a sophisticated rig...but it does do a good job.

With ford's you need to replace the power lines with 2 runs of coax. Ground both sheilds at the battery and the fire wall and use the center leads to run the DC.
2, 2 amp RFC's from radio shaft, one on each lead and a 500 Mic Cap on both ends of the positive RFC's to ground. there will be no noise at the radio.

Obtain from your Ford dealer the kit that isolates noise from the electric
fuel pump in tank.

Also I think he meant Radio Shack,not radio shaft

I've pretty much decided to go that way, as it inolves no time or money expenditures, and the battery sits nicely on the front seat next to the armrest.

> Great little rig, BTW.

Concur. It's especially handy for backpacking. I take it, one 7AH battery and either a rabbit-ear dipole or an MFJ twinlead j-pole.

Ok, I can see doing the RFCs and caps; in fact, I'll likely build 'em into the radio. I'm not sure about the coax cables though. I've got a limited space in the punch-out in the firewall and I'm already feeding a couple sets thru there. Think RG-58A/U (solid center, 100% foil shield) would be sufficient for 20A at 12V? Or should I go with RG-8? This run also powers my FT-100 when it's in the car (I feed from the battery to a pair of banana jack/binding posts on the dashboard - very handy for all kinds of stuff that needs 12V).

> Obtain from your Ford dealer the kit that isolates noise from the electric

Ah, electric fuel pump. Forgot about that one. I figured it was almost all ignition noise, since it turns the radio into a dandy audio tachometer (rev the engine and the whine goes up in freq :-)).

> Also I think he meant Radio Shack,not radio shaft
> 73's Jock KC6IIH

I tend to refer to it as Radio Schlock, myself. :-)

I have been using mine for mountaintopping pretty well
as you describe, but with a 5w Unisolar flex panel.
With the 7Ah and solar you can run for a long time.
But I have a Mizuho 6m HT and just received a Tokyo
Hi-power HT-750 for that, so I might put mine in the
car too.

Date: 2003-11-07 19:24:27 UTC
From: ve7baq
Topic: 3964 Message: 3964

I have tried to email Par Electronics about the pricing and availability of the SM-150 Stressed Moxon antenna but the email wouldn't go through. Has anyone on the reflector used one of these and how did it work? Where did you buy it from and were you satisfied? I tried twice to contact Par Electronics and both times the email couldn't go through. As I see it, this might be a solution to erecting as small antenna in a restricted area, I don't have much room and the tower isn't up yet. One of those "I got to get going on it" jobs! Einar VE7BAQ

3965. RG-8 vs RG-8X

A quick question about coax. I have about a 35 foot run to my antenna. Due to some spacing considerations, I'd prefer to use the thinner RG-8X instead of RG-8. One "expert" told me this would suffice for 6 meters. Opinions? Thanks.

I've used runs of RG-58A/U in the 50' range for 6m antenna hookups
without trouble. I'd expect there not to be too much difference betwixt
RG-8x and RG-8 at 35'. Should be fine.

I cannot remember the spec on 8X at 50 MHz but IIRC, 35ft is ok.....anything less than 50ft should be alright in 8X......

[Scot Clayton] I've personally had more problems with 8x. I'd prefer to use either 58 or 8, or better yet, 9913, 214, etc. etc.

BTW, Bruce, it is SO cool that your grand-dad was THE Frank McIntosh, WOW!

RG-8X typically has a 1.8db/100' loss at 50 MHz
RG-8 typically has a 0.9dB/100' loss at 50 MHz

At 35' that would be 0.6 loss total for RG-8X and 0.3 dB for RG-8, or fairly insignificant.

There is a difference in power handling capability though. I assume your not running more than a few hundred watts through the RG-8X?

I certainly thought so. :-)

OB Radio: When my brother and I were going through the hamshack after Dad (Ken, W3PNT) went SK last year, I came across a set of blueprints for the Voice of America transmitter building and antennas in Saigon. Mr. Mc worked on it and some other overseas projects for VOA back in the late 40s/early 50s timeframe. I now have the .45 that he said he carried in VN for self defense.

OB 6m: Has anyone considerd various approaches to installing/matching a 5/8 vertical on a car? I've got the stereotypical 5/8 2m used as a 1/4 for 6, but that involves moving coax around between the radios which is awkward at best while driving. :-) Besides, I'd like the extra gain on 6, and any sort of horizontal mobile antenna has insufficent WAF (Wife Acceptance Factor) to pass muster. I figured on using a 102" Radio Schlock whip and a short length of 1/2" EMT between the 3/8-24 mount and the whip, with a "big whip" spring between the pipe and the whip for low-hanging-object flexibility. Sound workable? I figured I'd do this on a trunklip mount, down low, with some kind of matching network inside the trunk lid. If this isn't workable/practical/not-ugly (WAF again :-)) my fallback is just to put a second 2m 5/8 magmount on the car for 6.

I just purchased mine from Universal Radio a couple of weeks ago. $74.99 plus $4.50 ship. I think this was a little cheaper than buying it direct. As I remember, PAR was $79.99 plus $7.50 ship. Had it in a couple of days too. So far, I am very pleased with it.

A 5/8wave for 6 is a bit too long......you wont be able to drive into garages or under drive throughs (think
broken lights! Been there with a 102" whip!)...
If you want ease of use, build a simple diplexer (or buy one) and put it at antenna coax with jumpers to each radio...no cable moving at all...and you can easily build one with PCboard and some caps and wound coils..You can use the antenna on both 6 & 2 at the same time.....I do that all the time with my Larsen NMO-150

5/8ths on 6M is about 140" (11.7'), so you could use a cut down 12' whip.
It wouldn't make sense using a shorter whip as you would lose the 5/8ths
advantage.

I made one about 5 moths ago just to see if I could and after about 3 hours
and $15 US I had one that worked really good I figured the gain to be
about what the stress was and the F/B was 20dB as I tested it locally with
some fellow ham.

We are pretty lucky here in Northern Alabama as we have many ham's to test
6 meter ant. with.

I used 1/2" solid Aluminum for the elements (I know over kill and heavy)
but its all I had for material.

just do a search for Moxon on the net lots of info.

I have an Alinco 70TH 100W 6 meter rig....
includes 160-10 meters plus Mars and 11 meters....

asking Best offer > 450$ includes seperation kit,
and instruction book w/ original box....

works great and still puts out 100W SSB and CW..

You can get a Ranger 5054 or an MFJ-9406 for under $300. Both quite capable. If you want portable, there are Mizuho and Tokyo HT-750s around (somewhere), and they are also very good if you want QRP.

If you use a trunk lip mount, the first time you get into a low tree lime you will open up your trunk, the hard way. Go with the bumper of a BIG ball mount in a real good spot. WAF allowing. If not, the 2M mag.

Not to mention the commercial radio lists...including LMR and others..
Rodney seems to be crossposting this in groups that dont need it..
His original post was in the radio-programming list because of spammers
and other junk..The LMR list has been online since 1998....so starting a
new list was somewhat unneccessary...

3998. BNC antenna for portable 6m SSB radio?

Yahoo group: 6meter (2000 — 2003)
Date: 2003-11-09 14:25:57 UTC
From: Andy Cogswell
Topic: 3998 Message: 3998

Hello all. I may be buying the FT-690II soon (For $225!). It comes with a BNC connector and a rubber duck antenna. Can anyone recommend an aftermarket antenna for this type of radio for 6m? It has to be portable, attached to the radio. I am not looking for anything that requires a length of coax.

Topic: 3998 Message: 4000

Remember that running any vertical antenna will really hurt your chances
of talking to someone on 6 SSB.....especially with the FT690:

1) the FT690 is already low power in the battery mode..

2) any antenna on the radio itself is a poor radiator....even a 1/4wave
whip, due to the lack of ground plane...the radio? it's not big enough!

3) vertical to horizontal cross polarization will be a 20db difference..
that's equiv to a 100:1 power REDUCTION in xmtr power with the already
low power out of the radio AND poor radiation efficiency.

Best to get something you can break down easily like a portable
horizontal loop or even a dipole....otherwise you are wasting time and
RF on trying to work SSB with such. Now 6 FM? it might work.....but not
that great due to factors 1 & 2.

You can't change the laws of physics.....

I don't expect to be coming in 1st place in the ARRL VHF contests with
this radio.

> 2) any antenna on the radio itself is a poor radiator....even a 1/4wave
> whip, due to the lack of ground plane...the radio? it's not big enough!

That's what makes it portable - an antenna on the radio.

> 3) vertical to horizontal cross polarization will be a 20db difference..

For ground wave. Once it bounces off the sky, polarization is moot.

> Best to get something you can break down easily like a portable
> horizontal loop or even a dipole.

From my first post:

"It has to be portable, attached to the radio. I am not looking for
anything that requires a length of coax."

Thanks for the reply, though.

Andy: Chris is right re: the db loss w a vert antenna. BUT I keep a Comet GP15 triband vertical hooked to the switch box in the shack. Lots of people have vertical antennas on their mobiles and when the band is dead it helps me talk local with them. Plus I sometimes find I get better sigs on Eskip going vert when conditions are just coming in or going away. While Ham radio antennas are usually a compromise (money, space, restrictions etc) portable antennas are even more so. With that in mind I do remember working a ham in western AZ who said he was talking on his FT817 5 watts with just a "whip" screwed into the back of his radio. He was sitting at a picnic table if I remember correctly. Solid 57 signal, clear as a bell. Heck, go for it and remember my call, NJ is one of the last states I need for WAS. Come on 6 open up!

4006. Confused

Yahoo group: 6meter (2000 — 2003)
Date: 2003-11-10 00:02:35 UTC
From: hotwing_rider
Topic: 4006 Message: 4006

After setting up my 6 meter station with RCI-5054DX100, MFJ-906 and a 5el beam, I decided to add a vertical and purchased one. Now the 5el beam had a 1.2 swr at 50.125 when hooked directly into the MFJ-906.. I then hooked the vertical directly into the MFJ and it showed a 1.5 SWR at the same freq... NOT BAD! I then thought I would put in a switch box and that is when things started getting crazy.. SWR went out of sight on both antennas. I first thought it was the jumper between the MFJ and the antenna switch. Tried several and even made one with no avail. All gave the same indications of high SWR. I then thought it could be the antenna switch and bypassed that with a barrel connecter. Same problem.. Tried other barrel connecters and had the same problem. It seems like any length of coax added to either the beam or vertical raises the SWR beyond limits.. WHAT IS THE PROBLEM?? I tried grounding various places like the radio, MFJ and antenna switch.. Nothing changes until I hook the coax directly to the rear of the MFJ-906.. So HELP?

Any and all help would be appreciated..

Thank you,
Dan / N9BYY

Apparently you people are missing the point. I already have a 6 meter setup at home - an FT-100D with a vertical and a 3 ele yagi. I am buying an FT-690 and I am just looking for an antenna for the portable. I don't want one that I need coax for, because then it reduces the portable aspect of the radio! Please, I understand vertical vs. horizontal and what type of antennas are more effective than others. I don't need that advice, but thank you for taking the time to reply to my message anyway.

As far as needing NJ, 6 has to be open here in NJ for you to work me. While the midwest and even the southeast operators are enjoying great conditions, they've been terrible for me, at least during the times I have to operate!

Well, SWR is a funny thing. If you could magically move your SWR meter up and down your coax, you would notice it changing as it moved. The problem is your SWR meter itself, in that it isn't truly measuring your SWR.

Do you have anything else to measure the SWR with?

You should really be using something like a Bird 43 meter to measure SWR, but I understand not everyone has one.

What type of coax are you using up to the antennas?
What was the jumper made out of?
Are you positive the jumpers are good, and all the connections are soldered?
Could the SO-239 on the MFJ be damaged somehow?

Keith,
The coax is Belden 9913. The jumpers are soldered and of the same stuff. They have all been checked with a ohm meter. The jumpers are different lengths thinking that may have some change.. I had checked the MFJ SO-239 also thinking there may be a problem there but didn't see any.. I have not changed SWR meters yet but I will give that a try next..
Thanks for your help

If changing the length of coax changes SWR, your antenna is NOT matched correctly...you just found one of the fallicies of using a SWR meter at the xcvr end...You must be at a min SWR point IN the coax....changing the length of course will put you at a different point in the "waves" and make the SWR look higher...SWR should be checked at the antenna end OR at any multiple of halfwave in coax....that way the true SWR AT the antenna is shown....when the SWR is low at the antenna, it is low throughout the system...when it is HIGH at the antenna, you CAN fake the radio into "seeing" a low SWR if at the right spot....and I bet thats what you have...

Take the SWR meter, move it to the antenna, retune the antenna for min SWR...THEN you should be ok with added coax, the switch box, etc..

Remember 6 is VHF and a 1/4wave is now 54 inches....where as on 10mtrs and lower, its much farther between wave peaks.

Hope that explains it.

Probably just has a high SWR AT the antenna...and the feedline is transforming that to a LOW SWR at that point...adding or removing any length will change the apparent SWR...he needs to retune the antennas with the SWR meter AT the antenna....(Personally I dont trust anything but a Bird above 25-30 MHz!!!)

If he had water, he COULD be seeing the same thing (a short at a point down the coax could cause this)...but with a new antenna and a new piece of coax, I bet its the antenna that needs checking....and retuning.

One way to check it is put a 50ohm dummy load in place of the antennas..see if the SWR is still high....if not, the coax is fine... the antennas are the issue...if the SWR remains high with the added length and the dummy load in place of the antennas, then he does have a problem in the coax.

Sure....
LP filter (HF - 6m) input consists of:
From input-> 1st coil in series 4T 1/4in dia (ALL wire 18 or 20ga solid) then 54 pf to gnd...2nd coil in series 7T 3/8in dia then 41pf to gnd....3rd coil in series another 7T 3/8in dia to common antenna port.. (use caps in parallel to make correct values if you cannot find the exact value...IE: 39pf + 2pf for 41pf)

HP filter (2m-UHF) input consists of:
30pf in series then 1st coil to gnd (3T 1/4" dia) then 15 pf in series then 2nd coil to gnd (same as 1st coil) then 23 pf in series to common antenna port.

Keep ALL leads as short of possible...you can use std. cermanic disk caps or silver micas (use 250V-1KV rated to be safe) Build on PC board using X-acto knife or Dremmel tool to isolate pads on the copper for soldering caps and coils together and use course use the outside copper around the pads as ground...I can send you a scanned JPEG if needed..

You can even make the box and interstage shield from double sided PC boards...(shield is "wall" between inputs stages to prevent coupling; just cut a piece long enough and solder it on both sides at bottom edge)

OR you can buy one from Comet or Diamond....but they aren't hard to build and probably cheaper depending on where you buy parts.
(choice of and how to mount connectors is yours)

Your best bet would be to find a used Yaesu FT-690mk2. This is without a
dobut the best portable 6 meter multimode you will find. Great sensitivity and
selectivity for a radio of this era, the battery pack allows operation at 2.5 watts
and has low power drain (80mw vs. 400mw with the FT-817).
The antenna connection in the portable mode is a telescopic whip with a
loaded base coil w/ BNC connector. As a mobile, the radio slides into a cradle
with a 10 watt amplifier for improved performance w/ so-239 connector to an
antenna on your vehicle.
This radio has been proven a winner as a rugged, reliable over the sholder
portable (I still take mine when camping and backpacking) I own TWO of
them, and will not part with either.

Noticed a couple folks commenting on the new TS-480 that is due
out around the 15th or so. I noticed there are a couple of Yahoo
groups already set up in anticipation.

Also be advised that HRO is already taking orders for the radio!
As for the cost, I understand it to only be a little bit less than a
TS-2000!!!!

TS-480@yahoogroups.com and KenwoodTS-480@yahoogroups.com

To subscribe, simply put the word subscribe just before the @ and just
after the group name.

The "KenwoodTS-480" seems to be the more active of the 2

Universal Radio has their prices up on the new Kenwood --

TS-480SAT = $1299.95
TS-480HX = $1449.95

As I said in my last message, it is a bit steep compared
to the Kenwood TS-2000 or even the Icom 706MkIIG, but it
is new model, and prices will come down soon and rebates
will soon be offered, I hope...

Looks like a nice radio, I would love to replace my 706
with it.

If it is bouncing around (sorry, didn't have time to read every bit of the exchange....) there is another possibility. I've run into several PL259's which would not screw completely into place onto a particular SO239. Turns out the shell was too long for that particular SO239, so the shield contact was poor....SWR bounced around like crazy. I swapped the SO239's for US made ones...problem went away.

Second thing? Check for secure grounds/connections in anything marked "MFJ." First thing I do is resolder all grounds and check wiring. The MFJ product designs aren't bad, they're just built that way. (apologies to "Roger Rabbit") I've found poor connex in several of their products....worth cleaning up the connections, oftimes the products work quite well after "fine tuning." Sounds like you've done this, tho....

Folks,
The pricing has been available for about a week now at Universal Radio's website, which is usually the first with new equipment. As I recall, it is about $1500 for the 100 watt version with tuner. The Universal website was where I first heard about the rig last month.

Looks like I should have read all my messages before replying, especially
if I am replying with faulty info! Sorry!
Anyway, the Universal website (www.rffun.com) is usually first with new
rigs and prices.

Hello all. I may be buying the FT-690II soon (For $225!). It comes with a BNC connector and a rubber duck antenna. Can anyone recommend an aftermarket antenna for this type of radio for 6m? It has to be portable, attached to the radio. I am not looking for anything that requires a length of coax.

When you get your 6m portable thing going, join Six Pack Radio. I have worked people 100 miles out with a Mizuho at 250 milliwatts on SSB, using the Hypower whip.
Six portable can rock!

Not quite. I'm not looking to set up a field station, I am looking to
setup a PORTABLE station.

I also have a 5054, 906 tuner and MFJ beam. I had a similar interest, and tried three different patch cords, from 6' of RG8x to 12" of Tandy 58 from the tuner to the radio, and didn't see any difference in the SWR.

But not pushing the SWR button on the 5054 DOES make a difference (I know -duh!). :^)

Subject: [6 Meter Sked] Confused

After setting up my 6 meter station with RCI-5054DX100, MFJ-906 and a 5el beam, I decided to add a vertical and purchased one. Now the 5el beam had a 1.2 swr at 50.125 when hooked directly into the MFJ-906.. I then hooked the vertical directly into the MFJ and it showed a 1.5 SWR at the same freq... NOT BAD! I then thought I would put in a switch box and that is when things started getting crazy.. SWR went out of sight on both antennas. I first thought it was the jumper between the MFJ and the antenna switch. Tried several and even made one with no avail. All gave the same indications of high SWR. I then thought it could be the antenna switch and bypassed that with a barrel connecter. Same problem.. Tried other barrel connecters and had the same problem. It seems like any length of coax added to either the beam or vertical raises the SWR beyond limits.. WHAT IS THE PROBLEM?? I tried grounding various places like the radio, MFJ and antenna switch.. Nothing changes until I hook the coax directly to the rear of the MFJ-906.. So HELP?

Any and all help would be appreciated..

Thank you,
Dan / N9BYY

Thanks Barry,
But if I'm reading you right, you changed the jumper between the radio and MFJ.. This is not the problem... The problem exist when I attempted to put a switch box in line to switch between antennas, thus making the feed coax longer on the antenna side of the MFJ 906..

During further experments, I tried different jumpers between the radio and MFJ tuner and didn't notice any change on the MFJ turner. It's only when I extend the coax on the output side of the MFJ..

Thanks for all you help,
Dan / N9BYY

Dan,
as I said before, tuners are not a good idea at 6 and above....get rid
of the tuner, tune the antenna AT the antenna for min SWR there, and all
your problems will be gone....I donot and never will trust "tuners"
above 15 meters...all they do is give you a false sense of security
(they do NOT improve the radiation efficiency of an antenna; if the
antenna is broke, fix IT!) but in reality the feedline loss has gone up
much more due to higher SWR...
And I personally am a little skeptical of a lot of MFJ stuff....
(the VHF tuners especially)...do love their analyzers though!
Tune the antenna with a good QUALITY Bird wattmeter, etc at the antenna
end....then check the MFJ again.

4032. Re: [6 Meter Sked] BNC antenna for portable 6m SSB radio?

Yahoo group: 6meter (2000 — 2003)
Date: 2003-11-11 06:00:35 UTC
From: James Carlin
Topic: 3999 Message: 4032

This reminds me. If you could get by with a vertical antenna for 6 that is very light and portable, get creative!!

I built a few full size 6 meter j-poles using speaker wire. I used either 12 or 14 gauge stranded speaker wire, available from Radio Shack for cheap. You do not need good speaker wire, the cheap stuff should work just as well. I cut the wire to length as per the j-pole calculators - remembering to add an inch or so to each piece to allow me extra wire to twist together and solder. To give the antenna shape, cut up a stick and used the pieces to keep the short element parallel to the long element.

Anyway, the end result was a 6 meter antenna that proved to weigh next to nothing and was easy to store. You could simply ball the thing up and stuff it in a plastic bag. To deploy the antenna, all you had to do was hang it from a tree branch (or whatever) with fishing line. Attach the line to the top of the long and short element.

I built the antenna because I was talking to some people who bought tri-band HT radios which included 6 meters FM. The stock antennas supplied with the radios were about as useful on 6 meters as a dummy load, so I made some j-poles. They seemed to work out OK. I would not run much more than 10 watts through these antennas, unless of course thicker wire was used.

I suppose you could use speaker wire to make many different antennas. Maybe even a yagi if you got creative enough (think speaker wire and wooden dowels).

-- James KF4OUI

If you really want a whip, the Tokyo Hypower ones for their HT-750 are probably the best, and they are still available.

OK, now you have my full attention. because I plan to do the same thing on 2m - switch from the groundplane to the beam. So you are saying the little addition of the cable from the switch to the 906 deranged the SWR? Maybe the problem is some leakage in the switch - not enough isolation - so you are trying to tune TWO antennas?

I have a Daiwa CS-201 switch - I assume a cheap one, and haven't tried it yet - don't have the beam installed at this point. But I will in a week or two. So thanks for the heads up, and please post the solution if you find one!

OK, I have an MFJ analyser and am about to put up my MFJ 3-elem 2m beam. It has a capacitor built into the boom. Are you saying I should tune it AT THE ANTENNA? I was planning to adjust it with 50' of 9914 between the beam and the analyzer - since that is what the radio will see (I don't have a tuner for 2m). The 9914 SHOULDN'T contribute much loss anyway....

Thx & 73

YES! Always tune an antenna AT the antenna if possible....With the
analyzer you can couple it straight to the antenna OR use a
1/2wavelength of coax (1/2wl free space x velocity factor)..
If the antenna is NOT 50ohms, etc, ANY length of coax OTHER than a
multiplie of 1/2wl can transform the SWR to a different value...
regardless of whether the coax is the same impedance or not.

The best way to ensure the system is correct is to tune the antenna AT
the antenna....then ANY length of coax will be ok.....Tuners tune the
coax, they do not tune the antenna....on HF, its acceptable since loss
in the coax due to higher SWR ALONG the coax (which can reach as high as
10:1 in some cases at various spots) doesnt add much to feedline loss..
On VHF, this additional loss at high SWRs is very detrimental...and
should be avoided at all costs. Also HF antennas are narrow in bandwidth
because of the freq and % of coverage...not true at VHF/UHF....thus a
tuner is NOT needed to allow the rig to "see" a wider bandwidth and
produce full power out.

On VHF, get rid of the tuners, fix the antenna AT the antenna, and you
will be MUCH better off.

Don't worry. This isn't the typical results of adding an antenna switch. I've had the same setup as the original poster - an RCI-5054 (I had the 25w version) with two antennas and an MFJ switch - no problems. I currently have an antenna switch in place for my dualband 2m/70cm vertical and yagi antennas and I have no problem with SWR. Tested after the switch and before the switch with an MFJ antenna analyzer, it's fine.

You should use a short length of coax at the antenna, just enough to make it from the analyzer to the antenna when it's up in position, adjusting the antenna if needed, standing on your roof or wherever you have the yagi. I put up a Cushcraft dualband (2m/70cm) 5 ele yagi and it needed no adjustment. When you get back in the shack, double check the SWR at the end of the coax.

True....but be sure you are not influencing the field around the antenna by your physical presence.
In other words, if I have a 1/2 wave section of coax attached to a 6m yagi or moxon or vertical on
a 10' or 12 ' pole for tuning, I'll be close enough holding the antenna analyzer to affect the field around the antenna and can cause the swr to be off as well.

I always try and have the antenna as high and as far away from objects as possible when I am tuning it.
I run enough coax (I have several jsut for this purpose) so that I am in the garage and not causing any
interaction with it. Yeah I have to walk about 6 steps to get to it and have to move a 11' piece of fence top rail I use as a testing mast.....but it works and allows me to get a better match at the antenna.

if you are not in the plane of the radiation (Horiz in this case), you likely will not be affecting the antenna...
One trick done on HF antennas is to point them straight UP so the reflector is close to the ground and the rest of the antenna is pointing away...this make the pattern look into the sky
and reduces influence of nearby ground objects on the antenna while tuning prior to installation...of course its not perfect but close enough....

Also please note that I said you can use a multiple of 1/2wlx VF in the line length....this reflects the actual Z at the antenna to the end of the coax....(in fact no matter what type or Z of line you use will work here as long as its 1/2wl long x Velocity factor of that line)...

Of course once the antenna is tuned, then ANY length of correct impedance line needed to get to the radio will be ok...

Even bypassing the switch with a barrel connecter, just by adding additional coax, causes the SWR to raise... The switch I'm using is a Daiwa CS-201 rated up to 600mhz.

Date: 2003-11-13 18:03:58 UTC
From: yaichaboo
Topic: 4046 Message: 4046

Well, a few weeks back when I listed an FT-650 for $1000.00 I got a lot of flack about my price. Lots of jokes, laughs & monkeys jumping around. I hope you all had quite a good time over this. I was rather amused myself. But the reality is I doubt if many, or any of you for that matter, have ever see or used one of these rigs. It is without question the finest 6 meter rig ever made bar none. Usually the only way you'll ever find one is in a silent key's collection. People that have one will rarely ever let it go. I happen to have 2 of them & I am going to let one go.

Back to all you talking monkeys jumping around saying it's not worth more than $600.00 to $800.00 . The radio sold new for $1700.00 to $1800.00 and was worth every penny! I feel sorry for all you cheap bastards that want everything for nothing as you will never get the opportunity to work 6 on the best radio ever made for 6.

I'll be putting the rig up on eBay someday & I know the hams that truely know of this rigs capabilities & characteristics will bid appropriately and everyone will be happy in the end.

1) I will have gotten a fair price for a fine rig!

2) Some lucky ham will have bought himself a fine rig!

3) And all you monkeys will have had a grand time laughing & giggling & jumping up & down

It's a Win, Win, Win situation!

73 & let me leave you with these parting words:

Screw monkey, no peanuts!

Anyone who paid $1000+ new for a Kenwood TS60 should be flogged in my opinion; yet bet you dont any of them getting verbal abuse...and from what I have heard, the FT650 was a much better radio....

Now anyone buying a used anything for much more than a NEW and better replacement may need to have their head examined..(like buying an ACC rptr controller for MORE than a NEW
Linkcomm would go for...and the Link would DO more!?!...)

I must have missed this discussion. What exactly makes the FT-650 better than any other 6 meter rig?

Here's what I found on the net:

It's a triband radio (12/10/6 meters), all-mode
100w on all three bands

After doing a google search for: FS "yaesu FT-650", there were lots of old ads with prices ranging from $650 to almost $1000. The $650 one had the optional tone encoder and 600hz CW filter! Most seemed to be in the $700 range. With this search, I didn't find any recent ads, but I didn't do a more extensive search. I did manage to find one guy selling one for $1450 "FIRM" back in 1998, but a later post by him lowered the price down to less than $1000. Basically, as the years went on, it seemed the selling prices have come down and averaged around $700. This is most likely due to the cheaper priced HF+ rigs such as the FT-100D and the IC-706MkIIG.

Date: 2003-11-14 01:24:49 UTC
From: JJ
Topic: 3960 Message: 4052

Well I just found a FT-690RII to go with my IC-505.
I need to rebuild the battery pack on the 505 and use NIMH...full size
c-cells or double up on 2300mah AA's..
I could get 4600 mah on 20 AA'a or 6900mah on 30 AA's.
That could be costly but still fun. Actually I think the batterypack runs
6v.....so that would be 13,800 mah.
That could last a whole weekend camping trip.

At any rate I plan to stick with the 6m rigs of this type for a while. I
may eventually use a
FT-100D after I get my General....but most of my 6m work will still be on
the smaller rigs.

The 690RII should arrive next week with the amp.

I guess I need to look into a BNC whip for it too.
I've got a Half square I can roll up and go with but I'd like the whip too.
It can always double as a fishing rod...hi hi.

73,
Jon

4056. Newbie Antenna Question

Yahoo group: 6meter (2000 — 2003)
Date: 2003-11-14 18:59:15 UTC
From: taylormack
Topic: 4056 Message: 4056

I have an Icom 706KMGII, but now have to decide on an antenna. Since I only have my Tech license, I am restricted to operating on 6 meters and above, but I would like to be able to monitor the HF frequencies.

I need some stealth, but also live in a mobile home. Someone told me that a wire antenna 3-4 feet above the center of the mobile home (65 feet long x 12 feet wide) would work fine and get a decent signal out, as well as receive well.

Funds are limited, and I'm not looking at setting new DX records or winning contests (just yet), but would be able to get a signal out when 6 meters opens up. Also would like to be able to monitor HF frequencies when 6 is closed.

Any comments, ideas, etc would be welcomed.

Taylor
KD5ZJZ

Topic: 4057 Message: 4057

Sounds like you need a wire dipole! Limited funds are not a problem, dipoles are cheap to build. If you cut the dipole for 6 meters, you will not need a tuner. You will need two lengths of copper wire, each one 55 1/2 inches long. Total length will be 111 inches (9.2 feet). It is best to construct a dipole using a 1:1 current balun, but I have made dipoles without a balun (I took a piece of 1 inch PVC pipe, no more than 6 inches long, and wrapped the feedline around the pvc 5 or 6 times). Feed the dipole directly, solder the center conductor to one wire, solder the braid/shield to the other wire. Use an insulator to separate one half of the antenna from the other half. Do the best you can to waterproof the coax, water intrusion will ruin coax.

The 6 meter dipole will work for HF reception, but if you want to make a longer dipole for reception only just make it as long as you can, and direct feed it. For a reception only antenna you do not need to worry about coiling the feedline or using a balun.

Good luck!!

Taylor....the one problem I see with that setup, other than being a great cloudwarmer (i.e., great pattern going vertical due to prox to ground...roof in this case) is the roof of the MH. As most are of metal, it will affect the antenna, depending on how high, etc the antenna is above the MH. Any way to suspend the end of a wire from a nearby tree? An end-fed Zepp, a doublet, or several other variations of antenna can be made this way (all basically variations of the dipole). Of course, seeing that you probably would want to transmit on 6M, you'd either have to shoot for a resonant antenna on 6 or use a tuner. If you're just going to receive on HF for the moment, do a google search for 6 meter antennas. A great starting point is http://www.cebik.com/6m.html, as he has some excellent information. Prepare for hours of (fun) reading! I've built several antennas from his site, and have used his software (and informational notes) to design my own (current one is a 6M HexBeam for portable use).

If you have no trees nearby, I'd go ahead and string the dipole for HF as you mentioned, but do a Halo or Moxon for 6M. You (and the radio) will be much happier! Don't forget to start tuning on LOW power....sure you know that, but just thought I'd mention it....heh...cranking up the rig on high power while testing certainly stresses the finals....I've done it myself! Make sure you have a decent VSWR meter to check for resonance. A cheap pushup mast works great with a halo. Found out that Lowe's has 'em....cheaper than RatShak and they also had the support hardware.

Hope this helps!
Andrew

And if you're anything like me, you don't have the time to build an antenna. You can go on Ebay and buy a 6m dipole very cheaply and they are generally better quality than just using plain copper wire.

You can't be serious! You can construct a wire dipole for six meters while your computer is booting up! And what would be better quality than "plain copper wire" unless you are going to aluminum tubing or something?

Taylor: Antenna's are all a compromise. VHF antennas like to be up high and the larger the better but of course we don't all have the funds or room to put up a 100 ft tower with 50 ft boom length M2's.

I have my doubts about a wire antenna just 3 or 4 ft above a metal mobile home roof. An antenna must be resonant for the frequency your talking on and although I've tried a random length long wire on 6 meters (with a tuner) at 20 ft (off the ground) I didn't have any luck with it. I didn't even hear some pretty good openings.

I've always suggested the Par OA50 loop as a good 6 meter starter antenna. Although it's gain is in the negative numbers (as opposed to a dipole) I had good luck with it early last spring. With what I've recently heard about the Par stressed Moxon antenna I think that if I was starting out I would go with that up about 20 feet as the minimum I could live with. The Moxon has some gain and is directional while the loop is omni and has NO gain. 20 feet is the bare minimum I could live with (for a while). Neither antenna is so large as to be objectionable to neighbors and neither looks like a Ham (or CB) antenna to the uninformed. Both are flat and work well with ssb. Both cost about $80 thru AES and other companies. Note that with the stressed Moxon you'll need to turn it by hand or use a rotor (the cheap RS TV rotor works well for an antenna this light, another $80). Note that a stressed Moxon antenna can be homebrewed very cheaply if you care to go that way. You can also hear some HF band signals on these 6 meter antennas just not as well as a resonant antenna.

I hope that you're not living in a totally antenna restricted location. In that case you'll be stuck with hiding a tuned wire dipole up in a tree or something similar. Good luck.

James, I am also a newbie. I built a dipole a while back as you have described, but without a balun. What exactly does a balun do; how will it help me?

Can I add a balun to my 6-mtr dipole simply by wrapping the feedline around a 1" pipe as you mentioned? Should this be right before the antenna - or can it be anywhere on the feedline?

Thanks! Peter / KI4BYE

From what I understand, a 1:1 balun keeps the current equal on both sides of the antenna.

The balun also prevents having to strip the coax down to a center conductor and braid. Once you solder (or crimp) a connector to the coax, attach it to the balun, and then waterproof the connection with some of that coax seal stuff - you have a reliable water resistant setup. Water in coax ruins the feedline.

Wrapping the feedline around the PVC acts like a RF choke. It is supposed to help match the antenna to the feedline / transmitter. I really do not know how well this works, it was just something that a lot of antenna making websites mention - so I did it. To be safe I also use a tuner, but according to the SWR meter my dipole works fine on 20 meters. Put the choke as close to the feedline connection as possible if you use one.

James, I am also a newbie. I built a dipole a while back as you

4065. Another Antenna Question

Yahoo group: 6meter (2000 — 2003)
Date: 2003-11-14 23:28:59 UTC
From: taylormack
Topic: 4065 Message: 4065

I am quickly finding out that if you ask a ham about antennas, you get a lot of answers! Thank you to everybody for your comments and advice. I do have a tree next to the mobile home, but I'm not sure how high I can get into it, but will consider some of the previously mentioned designs

Another thought I have is to get on the air quickly (if not perfectly) is to use the Comet SB-15 for mytruck, but mounting it somehow on top of the mobile home right in the middle. Would that provide the best ground plane for the vertical antenna? Also, would I have to connect the antenna somehow to the metal roof for an effective ground plane or will it simply reflect enough off the roof?

I have some time to think and play with these ideas, because this weekend the university club is participating in the ARRL Nov Phone Sweepstakes, and I want to be at the club station to get some experience. The next weekend deer season starts, and I'm going to be out in the woods for a while.

I have been reading the posts here and really appreciate all the discussions from the members of this group. Still got a lot to learn, but have picked up a lot of good info here already.

I built a wire dipole antenna and just used a piece of bug deflector, yes off of a car, for my center insulator, from that I have wires that are cut to length to work (without a tuner) for 75 Meter, 40 Meter, 20 Meter, and 6 Meter and they are not more than 15 to 20 feet off the ground for now, maybe next year I might try to get it up a few more feet, but I DO NOT work contest so I don't have to be the biggest mouth on the air, as long as the person on the other end can hear me, what more do I need. I have a couple of other wires for 17 & 12 meter but when I was putting up my antenna those bands were open so I didn't take as much time to get them cut to the correct length so I would need a tuner to protect the radio, which I do have if I should want to use those bands before I tune them properly. I almost failed to mention that for the time being I am also using about 20 feet of RG-58U.

I don't plan on leaving it set up like this for ever, but for now it works.

I said all that just to say that you can get on the air with just about any set up if you aren't trying to wrap some bodies S-meter up in knots.

BALUN = BALanced to UNbalanced

A dipole is by nature a balanced antenna (so is a yagi with a dipole center/isolated feed...any "earth" GROUNDed antenna like a ground plane where the radials are also connected to earth ground/support OR a gamma matched dipole or other vertical or single wire antenna is NOT; basically, if one side of the antenna is connected to ground, it is not balanced anymore!

COAX is an unbalanced feeder; open ladder line IS a balanced feeder where both sides are not referenced to ground....(in coax, the shield IS referenced to earth ground just like the antennas above)

Balanced feeds are great at minimizing TVI, etc; a balanced line usually does not radiate due to its design and use (involves RF currents and phasing in the flow thru the line)...an unbalanced line like coax CAN radiate when any reflected wave (SWR) is present.

A balun connects a balanced load like a dipole to an unbalanced feed like coax thus reducing the chance of TVI, etc and also keep the pattern on the antenna "clean" (radiation on the coax can upset the antenna pattern and skew it)...because the coax is usually vertical in its run but can go horziontal to get to the radio room, the shield is a perfect place for RF to radiate into local equipment (TVs, Radios, etc) when the antenna is rejecting some of the power the transmitter is producing.

You want the balun as close as possible to the BALANCED load...thus at the antenna....if you try to create a balun (this being a 1:1 balun as it does NOT change the impedance as a 4:1 or other value balun can do!), the coax between it and the antenna will STILL be unbalanced...not a good thing! :)

By wrapping the coax in a tight form near the antenna, this acts more as a "choke" and kills any reflected power from radiating along the shield of the feedline......a balun can be as simple as this (again, a 1:1 or same input as output impedance in ohms but still unbal to bal!) or more complex with multiple windings or coaxial xfmrs (2:1 to 16:1 ratios)...

Hope that explains it in simple terms.

From: Christopher Boone
Topic: 4057 Message: 4076

James,
a tuner is mostly hype and not needed if the antenna is close to a good match in the 1st place...if the antenna is NARROW banded (high Q) and thus prevents the xmtr from putting out high power at the edge of the intended range of operation, a tuner CAN help out....but for the most part, if the antenna is good enough, you dont need a tuner....its a waste of money and components....It does NOT help in the TVI situation between the radio and the antenna....If the SWR is low already, the tuner is doing nothing and should not be inline already!
If SWR is high on the coax, the tuner will allow the RADIO to "see" a low SWR and thus produce more power OUT....but the SWR on the coax after the tuner can be extremely high and still cause TVI due to local radiation.....best to tune the antenna if you have a simple antenna with decent bandwidth....for wide coverage, a balanced dipole cut for the lowest freq and fed with open ladder line and tuner with a 4:1 balun at the output of the tuner is the best way to get max performance out of this simple wire antenna!

A balun is not needed for water prevention....there are ways to keep water out of coax without a balun (coax connectors and splits leads from them to the antenna connections).....or just use dux-seal and rubber tape to seal the coax up tightly to keep water out...also having the coax opening looking down will help keep water out of it....
but a balun alone is not a water prevention....it can give you an easier connection to the wire elements...and a support with a hook on the top of the balun....

Its not needed 100% of the time with dipoles....but sure can help in a number of cases of TVI, RFI, etc :)

BTW a choke can also be made by using ferrite beads slipped over the outside of coax....and taped together so it forms a long bead with the coax inside it....about 12 in or longer may be needed!....the ferrite beads stacked together act as a long choke to any RF on the shield outside (where reflected waves try to go)....thus killing the SWR waves before they can radiate on the coax shield.

James Carlin wrote:

> From what I understand, a 1:1 balun keeps the current equal on both sides of the antenna.
>
> The balun also prevents having to strip the coax down to a center conductor and braid.
Once you solder (or crimp) a connector to the coax, attach it to the balun, and then

waterproof the connection with some of that coax seal stuff - you have a reliable water resistant setup. Water in coax ruins the feedline.
>
> Wrapping the feedline around the PVC acts like a RF choke. It is supposed to help match the antenna to the feedline / transmitter. I really do not know how well this works, it was just something that a lot of antenna making websites mention - so I did it. To be safe I also use a tuner, but according to the SWR meter my dipole works fine on 20 meters. Put the choke as close to the feedline connection as possible if you use one.

Yup...nice place to visit...tho I'll pass on living there (I prefer mountains). However, you do get the opportunity to get some great 6M DX.....do dig up a good antenna (just finished a Moxon....I'll probably end up getting one of Dale's (PAR Electronics) as his is lower visual impact...the all-important WAF* is the problem). Any way to stick up a 6M Yagi? Even a 3 ele. will do well. Dec/Jan should be good months, possibly for double skip TE openings to SA.....bunch of Argentines are on 6M.

Cheers!

Well..."Look out world!". As I speak I have finished my antenna mast and the Par Electronics OA-50 is now a fairly respectable 18 feet up above the North Miami landscape.

I did consider the Par Moxon, but a rotator (manual or otherwise) was pretty much out of the question. So, next opening, post to the group, point your beams down this way, and give me a shout!

4083. TVI filters (including 6 m LP filter) FS

Yahoo group: 6meter (2000 — 2003)
Date: 2003-11-17 14:39:38 UTC
From: Ken Simpson, W8EK
Topic: 4083 Message: 4083

TVI filters For Sale:

Drake TV-1000-LP
Low pass filter for the transmitter
This is the filter that may also be used on the low
end of six meters, as well as HF. It is good for 1000 W
below 30 MHz, and about 200 W up to 52 MHz. It is in
very nice shape, with the copper is still nice and shiny.
$ 35

E F Johnson low pass filter
52 ohms impedance, Catalog number 250-20. This is the
cylindrical filter, with an SO-239 connector on each end.
There is also a variable cap on each end, for precise adjustment
to cure your particular TVI problem. $30

B & W 425 "antique" low pass filter
I know most people are not going to think that a B & W 425
low pass filter is that old, but this one is. It appears that the
case is made of copper, or at least copper plated, and then
painted. There are just enough of the paint flakes coming
off to see the copper underneath. The weight of this filter
is about twice that of the more modern B & W 425 filters.
In case any one does not know, the 425 is rated to take full
legal power, and cuts off just above 10 meters. $30.

Drake TV-300-HP
High Pass filter for the TV. 300 ohm twin lead.
This filter is collectable, and is unused as best I can
determine. It is still in its original box, with an "RLD"
logo on it, and says "NEW TV-300 HP High Pass Filter,
Attenuates 0-52 MHz". A grounding strap is also
attached. $ 15

TVI filter, made by Communications Power, Inc in the USA.
This appears to be a bandpass filter for use on 10 (or 11)
meters, and is rated at 600 watts. It has provisions for tuning
the input and output for maximum TVI reduction. SO-239
connector on each end. $ 30

Prices do not include shipping from Florida.

Thanks.

73,

Ken, W8EK

73 Peter / KI4BYE >>

Heh....I'm buying one just due to the WAF problem....the rotor is hidden beside the chimney cap in an AL box to look like the cap (which is galv.). However, my homebrew Moxon is much more noticeable than Dale's unit....so I guess I'll invest a few $$ in the US economy and get one of his.

I'll be on this PM mobile....lets see what happens! I'll try around 5:30 to 6 PM EST on 50.125.

Cheers!

Space Weather News for Nov. 18, 2003
http://spaceweather.com

The 2003 Leonid meteor shower began on Nov. 13th with a mild flurry of meteors over the Pacific Ocean. It continues on Wednesday morning, Nov. 19th, with a much stronger peak over the Americas and western Europe.

Sky watchers on the Atlantic side of North America are favored; they could see as many as 80 meteors per hour between 1:30 a.m. and 4:00 a.m. local time. Western Europeans and South Americans ought to have a good view, too, shortly before local sunrise. (All these times refer to Wednesday morning, Nov. 19th.)

In western North America and around the Pacific Ocean the display will be weaker, perhaps 20 to 40 meteors per hour, but that's still a nice shower. Favored sites include Alaska and Hawaii before dawn on Nov. 19th and Japan after local midnight on Nov. 20th.

Visit Spaceweather.com for updates and more information.

Farthest for me on 6m was with F5QT (France), using a 3 element yagi, about 3 feet off of the roof (A total of less than 20 feet off the ground) and 25 watts. Approximately 3800 miles. That was 3 Jan 2002. Farthest CONFIRMED contact was with GI6ATZ (Northern Ireland) under the same conditions on 6 Dec 2001, approximately 3300 miles. These contacts were from my old QTH in FM29ww (Toms River, NJ). This data compliments of VQLog! :)

Thanks for the tip. Tuned up and down. Heard a few weak signals. I was able to copy one strong signal on 50.135 @ about 8:30 PM EST. He said he was in Pittsburgh running 100 watts (I am in Miami, FL) - didn't catch his call, though - was it any of you? Tried a few CQs on 50.125, but no joy. Then the band went quiet.

This is really great getting an email when the band opens - I hope everyone in the group gets in the habit of posting when six opens.

Best of luck! 73 Peter / KI4BYE

Could just be timing, Peter. I had the FT-100 on [mostly because yesterday morning I heard an FN08 *in the car* driving to work, but he faded before I could grab the mic :-), and it got my hopes up], and when I started hearing FMs and FNs I dove for the mic. Got two good contacts in the northeast and thought, "I'm on a ROLL here!" when the phone rang. By the time I got off the phone an hour later, it was all gone! (*sob*) :-) Timing is *everything* on the magic band. Well, timing and having a good antenna up high...

Hi all,
I'm getting back on 6 meters about Christmas as my wife is buying me a RCI-5054 and tone board for Christmas. I looking forward to working the DX again. It's been too long. I have a question for any of you that own a 5054 and have installed the tone board. Is the tone board hard to install and what is involved.

thanks,
73 and Good DXing,

As far as I know, RCI doesn't offer it's own tone board. You have to buy an aftermarket one, such as Communications Specialists TE-32 (http://www.com-spec.com/te32.htm), which sells for around $50. I don't understand why RCI didn't modify their original "10m" design to allow a plug in tone board, or why they just didn't include it in the first place. It seems with the 5054, they changed what was needed to make it cover 6m and left the rest the same (hence the "Roger beep" button). I personally would love to see radios like this for 2m, 1.25m and 70cm.

Date: 2003-11-20 15:18:12 UTC
From: KD5SFA
Topic: 4105 Message: 4105

I recently obtained one of these fine portables in 9.5 out of 10 condition with amp, mobile bracket, battery pack, etc.
Instead of doing the mod on the mic to disable the dtmf keys I plan to replace it. Not a big deal. The manual has good pin-out information there.

I am looking for a good 6m whip on a bnc connector for portable operation. I may just make one (1/4 wave) and cover it in heat shrink tubing and have provision for optional counterpoise off of the bnc connector.

I would also like to mod the tuning knob to remove or lessen the detent so that it turns easier. It would make moving up and down the band easier...this is where the 505 shines. Has anyone done that ?

As of right now the receive seems a bit more sensitive than my IC-505 but I have no been able to put them side by side and switch antenna back and for easily yet.

Also, I figure the tone boards are hard to find.....has anyone hooked up a com-spec board to one with any luck ?

Catch you on 6...

From: Bruce H. McIntosh
Topic: 4111 Message: 4111

Ok, I'm thinking "mobile antenna" again. I built the "$20.00 Martian Death Ray" bugcatcher (see QST, April 2000) and it seems to work ok on 6, tho signal reports haven't been all that encouraging. Also, the antenna's quite bulky and bangs around in the breeze a lot even with snubber lines attached. Finally, that big coil up high tends to flex the mount an awful lot. I do, however, like the 10-20 potential for later this year (I'm planning on going General start of December).

I'm pondering something with a bit less mass up high and lower visual impact for improved WAF (Wife Acceptance Factor, a technical term borrowed from model railroading :-)), and lower weight overall for a kinder gentler physical load on the mount. I've seen a couple folks suggest autotuners in the trunk to a 102" whip, and one chap mentioned doing a base-loaded bugcatcher with the 102" whip. Given as I've got all the hardware, plastic pipe, wire etc and the 102" whip, I thought I'd give the bugcatcher idea a shot. Ideally, it'd also be able to work on 10 thru 20; 40 would be nice but far from necessary. Anyone tried this 102" bugcatcher idea?

I would assert categorically that homebrewing antennas is loads of fun :-)

i think the easiest would be to go with the hustler resonators start off small buy getting the 54in mast which will work with 6 meters and once a month or week you can buy another resonator for which ever band you want or you can find them used online really cheap and its rather low impact and when you want to change band just get out and change resonators
i think on the used market you should be able to get the 54in mast and 10,12,15,17,20 all for about $50-60
good luck

If it was polarization, it wouldn't be distorted, only weak. We were
both using horizontally polarized yagis. His (I would assume) was
pointed north, mine was pointed northwest, towards him.

well polarized was poor wording
but if you and someone else both being horizontal and one has his
antenna pointing away from you 90 degrees or so and you have your
antenna pointed off of him he would sound distorted i have heard it down
here in florida when someone say is in orlando and is pointing north and
i am as well or northwest a bit he will be distorted due to the scatter
effect on ground wave

For non DX mobile use on SSB or AM, get a horiz antenna like a PAR, or something homebrew like a halo, etc.....you'll be happy you did...whips are fine for FM but not good for SSB action...when the band opens, anything goes, but since the band is NOT open all the time, you want an antenna that will work when you want to talk ;)

I'm well aware of the non-dx benefits of a horizontal antenna. However,
it won't meet my criteria: 1) something also usable on at least the
higher HF bands, 2) something I can build from what I already have
laying about the place, and most importantly, 3) something that my wife
will tolerate being mounted to her car for our Christmas vacation! :-)
I may very well end up putting a halo or somesuch gizmo on *my* car, but
that's another story for another time. Lo-profile vertical (can be tall
but must be skinny) is The Way To Go for this application. :-)

Hell all,

New member from Northern VA here. I used to be active on 6 Yay-em with a Heathkit HW-10 which I stupidly traded for an HT when I went away to college. Now I am back on 6m with a VX-7r which does 6m Yay-em and FM.

I have noticed a serious derth of repeaters on 6m in the NCR area. Just wondering if any of the repeaters listed actually are on the air or if they are holding places until the operators build the systems. The other side could be I just cannot seem to bring them up with 5w and an HT with a telescopic antenna. (The repeaters are within 10 miles of me so I have my doubts that all of them cannot be brought up from either work or home.)

That's it for now. I look forward to hearing more from all of you on the Magic Band!

Dan S.

During Aurora (like yesterday) the audio on SSB will sound very garbled. It's almost like the operator has gravel in his mouth, or talking to you from under water.

Point your antenna North if you have a beam and leave it there.

What you are hearing is the signal bouncing of millions of charged particles in the atmosphere.

Typically you will hear contacts close by that would otherwise not be possible (< 500 miles) on 6M.

I have found you can enhance the signal some, if you can change some of the settings on your equipment. For 6M I'm using a Yaesu FT-726R and can change the settings of my IF. I move the lower skirt of my IF bandwidth up a little higher (20%), plus move the IF bandpass down a little lower (20%). I also move just my receive frequency with the clarifier about 1.0 Khz lower. What this does is narrow my IF, plus shift the pitch of the audio higher, back in out normal hearing range. It's still difficult at times to understand people, especially the weak signals you really want.

I played around with the DSP quite a bit yesterday, and have given up on using it for Aurora. I have not found a setting that really worked well enough to be useful. The DSP thinks the Aurora audio is noise, and tries to block it out.

I picked up a couple more states yesterday, and once the Aurora simmered down, the Caribbean came in strong for an hour.

I got Trinidad, Guadeloupe, St Thomas, St Martins, Puerto Rico on 6M! Oh yah!!

Welcome. If the repeaters are within 10 miles and you have a good line of sight to them then maybe they are all in PL. If none are listed in the directory that does not mean that they are not using PL. Start with either asking around the local 2 meter machines or by using a PL that is local to your area on 2 meter.

Good luck.

Yep it was open here (Virginia Beach - FM26) for a bit last night around 7:30pm

I actually worked one station in EM60. I was really surprised!
I'm limited by my homeowners assoc. and only have a ground mounted screwdriver antenna that is surrounded by houses. Normally I can barely hear myself with this setup :-)

An OA-50 is a Par Electronics Omni-Directional antenna. Par sells them for a few different bands, the OA-50 being for 6 meters. This link from the PAR website will explain in more detail:

http://www.rf-filters.com/omnis.htm

Additionally, the following link, the product review from eHam.net, was a large influence on my decision to buy this antenna:

http://www.eham.net/reviews/detail/1572

I bought it for a couple of reasons: cost, the reviews, and a lack of space for a beam. If you have any further questions, contact Dale Parfitt - he was extremely helpful with all my pre-sale questions (and I had quite a few): par@...

BTW: I know, I know...I sound like a salesman, but, honest, I'm just a very satisfied customer.

Hope this helps!

4137. VHF/UHF band opening

Yahoo group: 6meter (2000 — 2003)
Date: 2003-11-23 17:27:08 UTC
From: worksntv@aol.com
Topic: 4137 Message: 4137

VHF/UHF band opening will most likely occur Sunday and Monday. Looks like conditions could be anywhere from good to very strong. General direction of this tropospheric ducting will be toward the South and Southwest tomorrow, and South along the Atlantic coast.

You might want to purchase a grid map from the ARRL. They also have
worldwide atlases. I believe CQ might also have some grid maps and atlases.

From: Hector Cintron
Topic: 4137 Message: 4142

Hi

The band definitely opened today for the Caribbean to the states, I'm in San Juan,PR (FK68) and I worked CA, AZ, WA, FL, CO, NE, NV, MS.

The amazing thing is that I only started to play with 6m the last 2 weeks and my antenna is not properly tuned (I bended a few elements mounting the antenna on my tower, that's what I get for trying to install solo <bg>) I'm waiting to buy some Rohn parts to install it on my tower then I will lower the yagi. But I'm hooked.

I believe you are in grid EL95. I show you live near the cross streets of Keystone Blvd and Croton Rd. Your Lat/Lon is:

N 25 Degrees 53.527 Minutes (25.892)
W 80 Degrees 09.401 Minutes (53.016)

All grids are 1 degree North and South, and 2 Degrees East and West

EL95 goes from North 40.000 Degrees to 40.999, and West 80.00 to 81.999.

For reference, Wiley St near Hollywood is where EL96 begins, which is the Grid just to your North.

Icom has a nice printable map at:

http://www.icomamerica.com/downloads/usgridsq.pdf

The best way is to use a GPS unit it will give you your EXACT grid,and
longitude/latitude readings.
I use a GARMIN GPS III Plus.
This is a hand held device ,but can be used in
airplanes,boats,ships,camping,fishing.

hey peter
if you go to qrz.com and look my callsign up there will be a link to a website on that website are some ham radio files for download go and download Gridsquared232 and install it
its a wonderful piece of shareware when you plug in your lat/long it tells you what grid your in then allows you to punch in someone elses grid and it will give you distance and bearing to the station
good luck

Hey Peter,
Here is a site you might want to play with.
http://pages.infinit.net/ve2pij/
It has a Lat/Long calculation program and a conversion
to grid squares along with a host of other goodies.
Have fun!

Don't always trust QRZ.

In my own case it showed me as being in a different grid square than where I really was.

Didn't someone recently publish a listing of GPS receivers that did
lat/lon to Maidenhead grid square conversion? It appears my wife's new
Magellen SportTrak Pro doesn't.

I believe the "A" in ARRL is for American - and that does not seem to mean North America...

While ARRL's publication do carry some information for Canadians, it is basically a USA organization. ARRL's legislative efforts are devoted to US agencies and the US congress and the ITU/IARRU. I have not seem much effort on the part of the ARRL for dealing with Industry Canada or the regulatory authorities in any other country - other than the international treaty bodies...

Yes I realize ARRL is mainly American, but they have hundreds, maybe thousands of worldwide hams that belong. I used to belong many years ago and have over a hundred back issues of QST to show for it. I have not been all that active for the last few years but still have had many contacts asking for my grid square. I didn't even know what they meant! All I knew was my home address so that is what they got. Now it seems that most want a grid number instead of QTH. It seems we have a new type of hamming. Oh well!!! VE7AQ

I never realized this. I mostly use QRZ, but it's amazing that not all the callsigns are loaded at ARRL.

I tried a bunch of Canadian QSL cards I have recently received for 6M, and none of them were found at ARRL.ORG. All were found on QRZ.COM.

Sucks in my opinion!

What is amazing??? Did you take the time to look at what is returned
when you use the American Radio Relay League callsign search. At the
very top in very large letters is "FCC License Data Search". You are
not going to find very many Canadian calls listed in the FCC Database.

If you are looking for an official source for Canadian callsigns, try
the Radio Amateurs of Canada site at http://www.rac.ca/callbook/
The RAC webpage provides a link to the callsign database for their
country. You won't find many USA calls in their database.

Sorry to hear you bought a Magellan GPS. Everyone I know that bought a Magellan hated it. Complaints ranged from inaccuracy to incompatibility for APRS and more.

I own a Garmin Legend (e-trex series). It will display GPS data in several formats, including grids. It supports NEMA and 4 or 5 other data outputs. The Garmin website has all the manuals for their products in PDF format. The manual for my GPS even mentions APRS (briefly) under the section of "other GPS uses".

Anyway, I am sure Magellen improved their units, but from what you wrote they still have to play catch up to Garmin. If you get another GPS, go for one of the Garmin units - ebay the Magellen.

You can mount a horizontal antenna close below a vertical antenna without adverse affects. I had a Par OA50 mounted about 6 inches below a Comet GP15 triband and it worked just fine. The stressed Moxon (or any other beam) shouldn't be any different.

Actually, the wife bought a Magellan, for her own compulsion- er, hobby, of geocaching. She tried out several units, and borrowed a friend's Garmin for a couple of weeks before settling on it; it was easier for her to operate one-handed than the Garmins were. (*shrug*)

Anyhow, rather than drop bucks on another GPS, I'll settle for a utility on my PDA that'll do the lat/lon -> grid conversion. Shouldn't be too hard to either find or write.

Sorry for this 1 time off topic post, but just wanted to make as many aware of a possible scam.

Here is one of those emails that raise a RED flag to me, especially since I do not now nor never have in the past used PayPal. Just the fact they (who ever they are) asking for credit card confirmation makes me believe it is a way to try to find a sucker and try to give PayPal bad image. Also they used part of my email address which would not be that hard to find, instead of using my name, if I did use their service. So the reason I am posting this on all the news groups that I am a member of is to caution every one to take the time to really check things out. Just a foot note also, they should have used a spell checker on this when they sent it out, the word 'official' in the subject line is misspelled.

4164. Re: [6 Meter Sked] PAR Antenna

Yahoo group: 6meter (2000 — 2003)
Date: 2003-11-25 23:51:14 UTC
From: n4km@aol.com
Topic: 4158 Message: 4164

Ken,
If it were me, I would not worry too much about separation. You did not say for sure if the dual band comet included 6M, but beings you said it was a dual band VHF I will assume so. I would leave it down a foot or so from the dual bander and I think you will be fine. With the opposite polarization, you already have about 20db of separation. I don't think you will have a problem. This would not be true if they were the same polarization. I have had trouble in the past with HF antennas interacting, even when they are not on the same band.
Just my 2 cents. Hope it helps.
Hope to hear you on 6M.
73,
Kevin N4KM EL98

Ken,
If it were me, I would not worry too much about separation. You did not say for sure if the dual band comet included 6M, but beings you said it was a dual
band VHF I will assume so. I would leave it down a foot or so from the dual bander and I think you will be fine. With the opposite polarization, you already
have about 20db of separation. I don't think you will have a problem. This would not be true if they were the same polarization. I have had trouble in the
past with HF antennas interacting, even when they are not on the same band.
Just my 2 cents. Hope it helps.
Hope to hear you on 6M.
73,
Kevin N4KM EL98

Great...

That is just what I was looking for.

BTW... It is 2mtr/7cm antenna

Sorry for this 1 time off topic post, but just wanted to make as many aware of a possible scam.

Here is one of those emails that raise a RED flag to me, especially since I do not now nor never have in the past used PayPal. Just the fact they (who ever they are) asking for credit card confirmation makes me believe it is a way to try to find a sucker and try to give PayPal bad image. Also they used part of my email address which would not be that hard to find, instead of using my name, if I did use their service. So the reason I am posting this on all the news groups that I am a member of is to caution every one to take the time to really check things out. Just a foot note also, they should have used a spell checker on this when they sent it out, the word 'official' in the subject line is misspelled.

Hello Chris (like the name already!;)

Used to live in DFW myself (between Dallas and Addison)...
Just get on 50.125 USB and call...point the antenna south and see if anyone in the Metroplex will answer....There is some FM activity in the area but I know your rig cant work that....
I think you have a good setup......I live back down in Houston now..or else I would come give you a hand...
I'll forward your email on to a couple of VHF SSB guys I know in the DFW area.....and they will contact you directly.

I'm not local, but could help you in other ways.

Listen on 50.125 USB. Send out your call every once in a while.

DX on 6M is mostly dead, with band opening only once in a while. You could listen to 6M for a month straight and hear no DX, so don't get discouraged.

I monitor, http://dxworld.com/50propframe.html for DX in my area. I also listen to 50.125 when ever I can, as the reflectors are behind in time, and some times by the time it's posted the 6M DX is gone.

When you hear activity on 50.125, and someone calls "CQ KB9WMJ", or "QRZ KB9WMJ", respond to them with you call sign "KG4LQZ" or say it phonetically "Kilo Golf 4 Lima Quebec Zulu". Do this quickly and clearly. You could even add your grid square saying "KG4LQZ Echo Mike 13", or "Kilo Golf 4 Lima Quebec Zulu". Don't get discouraged if the other person hears someone else stronger, and works them. Just sit and listen and wait. When they are done with, send out your call again.

Be ready to say you name phonetically, know your grid square and tell the other operator how good their signal is using the standard RST (Readability, Signal, Tone)system, shown below. On SSB a perfect signal, with high signal strength would be a 59. The Tone is only used on CW.

Readability:

1 Unreadable
2 Barely readable
3 Readable with difficulty
4 Readable with little difficulty
5 Perfectly readable

Strength:

1 Barely detectable
2 Very weak signals
3 Weak signals
4 Fair signals
5 Fairly good signals
6 Good signals
7 Moderately strong signals
8 Strong signals
9 Very strong signals

Tone (CW Only):

1 Extremely rough note
2 Very rough note

3 Rough note
4 Fairly rough note
5 Note modulated with strong ripple
6 Modulated note
7 Near DC note but with smooth ripple
8 Near DC note but with trace of ripple
9 Pure DC note

Keep a log of each completed transmission, showing:

Time in Zulu
Date in Zulu
Call sign you talked to
Frequency
Mode
RS Report
Name

And when you make your first contact, sit back and enjoy it.

Well, it would be, if everyone's rig was correctly calibrated on every frequency,transmit always matched receive, and everyone could agree on the proper pitch of the other ham's voice, without ever hearing him before!
The proper use of RIT is this: if you call someone, go to his frequency and call him. You will not need your RIT. If he doesn't like your pitch, though, he'll use his RIT to tune you in.
If you are called by someone and do not like his pitch, use your RIT and tune him in. You are assuming that he tuned you properly before he called you.
Operation of a rig without RIT means that if someone calls you and seems off-pitch, you will tune your VFO, and then he tunes his, and then you tune yours, etc...This happened a lot when few hams had RIT, and we wandered up and down the band, trying to tune each other in. NOT good.

I think that is because ARRL just looks up the FCC data, unlike QRZ where you can add yourself. The converse is true on the RAC lookup too (which looks up IC data).

Not in Canada! If you go to ARRL website and type in a VE7 Call it can't be found! I did not try callsigns from any of the other provinces. QRZ.COM came up with the call signs but not ARRL. Must be an oversight?? VE7BAQ

Yes I realize ARRL is mainly American, but they have hundreds, maybe thousands of worldwide hams that belong. I used to belong many years ago and have over a hundred back issues of QST to show for it. I have not been all that active for the last few years but still have had many contacts asking for my grid square. I didn't even know what they meant! All I knew was my home address so that is what they got. Now it seems that most want a grid number instead of QTH. It seems we have a new type of hamming. Oh well!!! VE7AQ

I picked up a 6 meter RF Amp at a Hamfest today. It is a Henry Electronics Model 100C10. It shows maximum output as 100 watts with 5 to 20 watts in. It did not come with a manual. Besides RF IN and OUT, it has an odd 8-pin plug for power in on one end and a phono jack plug on the other.

Does anyone know anything about this Amp? Is there anywhere I can find a manual describing the two plugs?

Thanks. Peter / KI4BYE

Sounds like the phono plug is for T/R switching control from the PTT in the radio. The power plug is strat forward, one or more for + and -. A quick look see in side will tell.

If you don't find out any other way, email Henry Radio and they should be
able to tell you, if it is the same Henry that made the commercial amp I
inquired about last year.
I would assume the phono plug is a key line and the other is for 13.8VDC.
On the power connector some pins are unused; the pins that show continuity
to the chassis would be negative, and other pins that are used are
positive.

I have a Henry 2m amp as you discribed..If the 6m amp is anything like the 2m, the phone plug is for connecting a remote switch to disable amp..If you don't plug anything in it, the amp will work everytime you key the radio. The power plug is as told, one roll is + and the other is -. Open it up and you can tell.. I have the book on the 2m amp if it would help. I'm sure they are about the same.

This is to increase current capacity. Those little pins are not designed to carry 15A alone!

OK...A couple of final newbie questions.....
1. I should use all 8 pins so the current is "distributed around the pins"?

2. "...the phone plug is for connecting a remote switch to disable amp...". Do I need to use this? Is this switch to disable the amp in order to put out less wattage, or some other reason? Should the amp be disabled when receiving?

Thanks. 73 Peter / KI4BYE

Yes

> in order to put out less wattage, or some other reason? Should the
> amp be disabled when receiving?

Leave the phone plug alone. The amp should have carrier switching, in that once it senses input power, it will switch on automatically. You will hear the amp click, and it will draw current when transmitting. If for some reason this doesn't happen, we can re-visit this later. Sometimes the keyer circuit isn't working (or you have an amp without one), and you need to have the radio switch on the amp when you are transmitting. Don't worry about this yet, just hook it up and try it.

Also, I am not familiar with this amp, but there are amps made for FM only, meaning they are not suitable for SSB use. If the amp has an FM/SSB switch on the front then it's useable on SSB. If there is a delay in the keyer time (The amp takes a 1/2 second or so to disengage after you release the mike), then it's probably useable on SSB. Some amps have a adjustment that can be changed from the outside to adjust this delay, so don't worry if there is no delay.

Maybe someone on this list is familiar with this amp and can say whether or not a Henry
Model 100C10 is useable on SSB.

When I bought the Amp at the Okeechobee Hamfest on Saturday, I asked the seller quite a few questions. Of note: "Does it work?" and "Does it work for SSB?". He answered yes to both. I will be mighty PO'd if the answer to either is 'no'. I bought this amp specifically to be used on 6 meter SSB. I have no use for an FM amp.

BTW there is no SSB/FM switch.

Also, I have done a few Internet searches, but have yet to find any sites with info on this amp. If anyone knows of any sites, I'd appreciate the URL(s).

Thanks. 73 Peter / KI4BYE

Before you act too hastily, maybe you should look into converting it to SSB operation. If it is solid state I can't give you much help, but if it is a tube type you could change the bias voltage and a couple of other items and make it into a linear amp. If it handles XX watts on FM it will handle XX++ on SSB as the duty cycle is less. If it is solid state I believe it could be still done but I have no experience in that line. Anyway, you have it now and maybe it would be a good construction project for you if you want to get into building etc. Einar VE7BAQ

Here are some sites that carry old manuals. They do
have some Henry amps listed.
http://www.manualman.com/
www.w7fg.com
www.henryradio.com
You also might want to check out the different
newsgroups online. I got a manual free from a member
of one of these groups on Yahoo for the TS-600. Worth
a shot!
Good luck!

Just starting reading the thread....sorry 'bout it being an FM only amp.
However, you (as someone else mentioned) may be able to modify it.....there was a
QST article with the details for a 100W 6M amp....you may be able to do a
"winter project" to modify it. I'll look for the article and email it directly,
if you're interested.

BTW, where did you find the amp data? I, too, have a Henry amp
(ex-commercial...45 mhz) and would like to find some data before I start hacking on it.
"More Data!"

Tnx!

Modifying the Amp is a possibility; if you find the QST Article, I'd like to at least look it over. The Henry Radio link I found is: http://www.henryradio.com/ss_pricing.htm
If you follow the link back to the home page, there's a whole menu of info. I emailed Henry Radio and got a very quick (3 - 4 hours) response. Ted S. Henry confirmed that it is FM only. He also offered to send a copy of the manual, and I accepted his offer.

So, right now I'm not sure what I am going to do. If I sell it, I'd just like to get back what I paid for it at the Hamfest: $35 (plus shipping). And I should have the manual to go with it in a couple of days.

Tnx....I had been at the radiodan site, but no joy. Mine is first cousin to
yours (C100C02...that "C" means class C amp, I'd bet)....I'll call them and
get a schematic. Mine uses MRF453A's, which get marginal at 50mhz+, according to
my data.

I'll also dig up that QST article and forward it to you. I actually built
one some time back...works great, just have to dig up the scanned in article.
IIRC, the 6mt.com site also had that article in .pdf format. I'll check and
get back with you. I'm also going to see if I can mod mine for CW/SSB
ops....should be a good winter project, along with the HW101 I'm rebuilding in my
"spare time." (heh...)

Cheers!
Andrew

4209. Re: [6 Meter Sked] Old 6 meter Amp/QST article on 6M Amp

Yahoo group: 6meter (2000 — 2003)
Date: 2003-12-02 13:02:23 UTC
From: MadDrewski@aol.com
Topic: 4209 Message: 4209

Found the file...it is in my FTP files as smbr.zip. Access is at

http://www.members.aol.com/maddrewski/

and download smbr.zip. You'll need WinZip on a PC or UnStuffit on a Mac to open. The design uses a single MRF492....I've got one here....amp puts out around 90W with 10W input from the FT736R. I have pondered using the MOSFET variation, but just haven't had the time to mod it....may do that with the Henry amp I've got. There are also copies of the Cushcraft A50-3 6 meter yagi manual in my FTP space, if someone needs them.

Cheers!
Andrew

hey guys
i have a question i have a cushcraft 617B 6 ele yagi that i trimmed down
to the dimentions of an A50S-6 the only big differnce is boom length and
driven ele
the driven ele on a 617B is a Tmatch so here is the question
i have everything set but the Tmatch and my SWR is way high
the resonant freq is 52.800 i want it to be 50.125 or so
so would i shorten the distance for the shorting straps or lenghten them,?
thanks

yes, but all you would have had to do was take off the first section of
direct elements and you would have been ok..I have played with one that I use as a
spare and it worked great that way..no cutting at all......band spread did not
change....

With my space limitations I have decided that a 6m halo is right now
a good starting point. Now I have to decide which one.

The Par Omniangle http://www.parelectronics.com/omnis.htm

Or the KB6KQ Loops http://www.kb6kq.com/index.html

I'm running up to 100 watts on an Icom 706MK2G, and hopefully can get
the antenna about 30 feet into the tree.

Are you preferring commercial over homebrew for a reason? If you want quality, I like the PAR. However, my homebrew Halo works just as well.....$5 of scrap AL and a few hours of pleasant tinkering resulted in a nice halo. 'Course, I also own a PAR...! For homebru, check our Cebik's site.

No time right now for homebrewing an antenna. Also no place to do the work. Otherwise I would probably homebrew something. Over Christmas Break (I teach at a university) I hope to build a small 2m yagi and/or 6m moxon.

FB...the PAR is quite good....I like mine. The other halo is like one or two I've homebrewed and also works fine. The Mox will work much better, but you will need a rotor. I actually have both...the omni to listen for openings, the Moxon to try to work 'em! Several good plans for the Mox online (built mine w/plans off the 'Net), but I'll probably end up buying the PAR Mox due to visual footprint, as the wife complains everytime I hang more AL in the sky....sigh. And I put up with her cats!!!!!!!

Hope you have some good students, too......

Cheers!

4224. Hybred Mini beam & 6M

Yahoo group: 6meter (2000 — 2003)
Date: 2003-12-05 21:46:29 UTC
From: Rev. Terry Mills
Topic: 4224 Message: 4224

Has anyone on the group used the Hybred Mini Quad on 6M? I know it is not optimized for 6, but according to specs it is "usable" there. I primarily want a "small HF beam" (I live in a parsonage, and the church people don't seem to think an antenna farm is beautiful) and would be very happy if it also worked on 6. I run an Icom IC746PRO with 100w out on 6 so just a few db of gain would be helpful.

Thanks in advance for any feedback.
Terry

I would pirate the tri or quad mag mount design. I forgot who makes this mount, but I see at least one at every hamfest I have ever been at. My motto - better to use more magnets than you actually need than to have an antenna decide to remove itself from the car on the highway.

I am going to assume that you will use the ATAS 100 on all frequencies it works on. If this is actually the case, I do not know how well your groundplane will be on the lower HF frequencies.

Lots of people use this antenna mobile. That's what it's made for! :)

Comet makes a trunk lip mount that is commonly used, but I don't recall the model number.

hey dan
i dont know if you have seen or tried to remove one of those 3 or 4
magnet mag mounts but once they are on the roof or trunk its very tough
to get them off so i think the ATAS would do okay on it
granted nothing is as good as a mechanical would be best in all areas
but sometimes one is limited to other ways
i seen the ideal mount for that antenna or the screwdriver types it is
a trunklip type but it electrcally lowers the antenna to gain access to
the garage and stuff

Yeah I know they might be rated for 100mph, but there are branches and such. Evil things that reach out and grab at vertical objects like antennas. I knew a guy who actually drilled into the roof of his minivan and roof mounted it. Made a ton of difference operating it, especially on the lower bands, but it also took a huge beating from trees during a mobile contest thru New England.

I'd really seriously think of some mechanical mount just to keep the antenna on the car as opposed to flying off.

Louis,

I wouldn't want to trust a big antenna to a mag mount. I had a Diamond 6m/2M/70cm whip about 5 feet tall on the roof of my Tundra for about a month, using a three-magnet mount that I thought was very strong. A low tree branch knocked antenna, mount and all off the roof, and to add injury to insult, the mount "reattached" itself violently to a side panel, leaving dings and scratches. Owie.

I know a center-mounted antenna on the vehicle roof theoretically provides the most even signal distribution, but I moved that antenna to a Comet trunk lip-mount on the hood, near the left-front cowl. I can tell some performance loss on 2 and 440, but 6M may have actually improved, perhaps because of better grounding. It's a case of a bird in the hand being worth two in the bush. A fair-performing antenna on the front cowl is worth more than a wrecked antenna rolling around in the bed of the truck.

If I put any bigger antennas on the truck, they will be in stake-pocket or trailer hitch mounts. The only antennas I will be putting on the roof are quarter-wave whips for 2 and/or 440 -- nothing more than a couple of feet tall -- and very flexible. The equivalent location on a passenger car would be either the cowl or trunk lip. I would try the trunk lip first, since there is a little more "ground plane" in that location. Of course, you may want to do the math to figure out how much RF you are radiating into the passenger compartment. Human biology and car electronics can be a little sensitive to that issue, as well.

Good luck & 73,
Tom, KT9OM

Keith,
(I wish I knew what you were talking about)...I havent seen any erotic mailings in my inbox from this list; of course I run Mailwasher and also have a Spam Blocker turned on at my earthlink account.

Maybe you need to change ISPs (AOL is costing way too much nowadays..you can get Dial up Earthlink for $21.95 and broadband cable or DSL for $21.95 for the 1st 6months and then 41.95 after that!...no I dont work for Earthlink but have tooo many coworkers who are switching from AOHELL to Earthlink where possible :)

Anyway, I saw no "erotic" mailings...did you check and see if they DID come through the list or the address was maybe spoofed where it LOOKS like it came through the list but did NOT! (I can show you how easy it can be done!) If they DID come through the list, there are ways they can be stopped...and Im sure they will be....but dont leave THE list because you see one or two such in your inbox. You can also go to Yahoogroups site and set the list to NOMAIL under your ID and then read the messages off the web site when you want to...and pass over anything that you dont like.

If 6 opens up in some weird fashion, that might be considered somewhat "erotic", especially if you sat around for weeks without any openings. And, if you sent an e-mail notice announcing the opening, some might construe that as an erotic mailing.

Well congrats and good luck on the class and the testing. I do know there is a 6m AM group that gets together on 50.4 AM Sundays up there. Keep a listen for that activity. I think they are based out of Albany. I am not sure what else goes on in that area.

You do NOT need code for 6m, however, if you want to know which beacons you are hearing or want to work some of the weaker DX you will definately benefit from being able to do around 10wpm. It sounds bad but it really isn't.

Good luck and 73's

Ask around the area hams for 6mtr users....I'm sure there is probably some on 6SSB or 6FM....a local repeater on 6 would be a good indication.....but then a lot of us also hang out
on 52.525...A web site shows the following 6m rptrs in NY state (not sure which are close to
your area)...1st number is rptr output, second if any is PL tone needed for access.
ROCHESTER 53.33
CORINTH 53.01
SYRACUSE 53.01
MARTVILLE 53.03
Worchester 53.03 100.0
AUBURN 53.05 71.9
PALMYRA 53.07
ILION 53.09
Tnawanda 53.09 88.5
GRAND ISLAND 53.09 88.5
ELBRIDGE 53.11
MELVILLE 53.11
ONEONTA 53.13
STATEN ISLAND 53.13
MALONE 53.15
WHITESBORO 53.15
Wilson 53.15 107.2
Bergen 53.17
HARRIMAN 53.17
ROCHESTER 53.17
BLOOMING GROVE 53.19
PRATTSBURG 53.27
NORTHVILLE 53.29
Beacon 53.31 114.8 (PL assist)
WOODSTOCK 53.33 162.2
Rochester 53.33
NYACK 53.37 Linked to 443.850 repeater
DELANSON 53.39
GRAFTON 53.41
Brooklyn 53.41 136.5 Linked to 441.100 and 29.66
ROCHESTER 53.43
PENN YAN 53.45
MIDDLESEX 53.47
MANHATTAN 53.55
SYRACUSE 53.55
MAYVILLE 53.57
Sherman 53.61 127.3 Linked to 442.75
CANADICE 53.63
GRAFTON 53.63

ROCHESTER 53.63 131.8 LINKED TO 919.025
SETAUKET 53.68

If HALF of the above are on and working, that's more 6mtr rptrs than TEXAS has!
Of course, you also want to be on 6 SSB and AM to catch all the fun...

A Tech license is all you need for 6mtrs....all modes (even CW!) is available..
gud luck on the license....and enjoy

I got 2 today spoofing [HobbyScanning], so I got curious, using Mail Washer and a 'Whois' look up, most of the info on the header was fake info, I did find a legitimate ISP name but let mail washer black list and bounce the email address since it did not come back to a Yahoo news group; I also got a fake [erotic] email claiming to be from this group myself but I just deleted it, so I do know what the claim of porn is about, the only thing is it did NOT originate from this group.

If 6 opens up in some weird fashion, that might be considered somewhat "erotic", especially if you sat around for weeks without any openings. And, if you sent an e-mail notice announcing the opening, some might construe that as an erotic mailing.

On Sun, 07 Dec 2003 20:01:34 -0600 Christopher Boone <cboone@...> writes:
Keith,
(I wish I knew what you were talking about)...I havent seen any erotic mailings in my inbox from this list; of course I run Mailwasher and also have a Spam Blocker turned on at my earthlink account.

Maybe you need to change ISPs (AOL is costing way too much nowadays..you can get Dial up Earthlink for $21.95 and broadband cable or DSL for $21.95 for the 1st 6months and then 41.95 after that!...no I dont work for Earthlink but have tooo many coworkers who are switching from AOHELL to Earthlink where possible :)

Anyway, I saw no "erotic" mailings...did you check and see if they DID come through the list or the address was maybe spoofed where it LOOKS like it came through the list but did NOT! (I can show you how easy it can be done!) If they DID come through the list, there are ways they can be stopped...and Im sure they will be....but dont leave THE list because you see one or two such in your inbox. You can also go to Yahoogroups site and set the list to NOMAIL under your ID and then read the messages off the web site when you want to...and pass over anything that you dont like.

From: worksntv@aol.com
Topic: 2065 Message: 4260

In 2003, the Geminid meteor shower will peak during the night of December 13–14, producing as many as 75 slow, graceful Geminids per hour if viewed under ideal conditions. They tend to be bright and appear yellow. Rates increase steadily for several days before maximum, then drop off quickly. The meteors that do appear after maximum, however, tend to be especially bright.

I copied this from Mobile Radio Technology magazine.
Atleast someone in the government is looking out for the right thing.
73 es Happy Holidays,
Kevin N4KM

FEMA: Broadband over power lines would harm HF radio
The Federal Emergency Management Agency has told the Federal Communications Commission in a filing that broadband over power line systems would create harmful interference for high-frequency radio systems.

FEMA said BPL systems use radio frequency energy on "unshielded and unbalanced" transmission lines, resulting in the "unavoidable radiation" of RF energy. FEMA's National Radio System is a high-frequency system that is the primary command and control backup communications media for the agency. It also interfaces with other federal departments and agencies specified by FEMA's Federal Response Plan, which coordinates federal assistance and resources in the event of major disasters and emergencies.

According to the filing, NRS radio stations normally are located in residential areas that would be serviced by BPL systems. In addition, stations maintained by the Civil Air Patrol and the Radio Amateur Civil Emergency Service are similarly situated and would be affected in a like manner. "The interference ... would render these essential communications services useless," the filing said.

LOL, I know that feeling. Right now I've gotten the WANED award. Thats "Worked All Neighbors Electronic Devices."

I've tried everything short of turning off the neighbors electricity and can't get the RFI to go away. My tiny little 50w/100w signal gets into everything TV, Telephone, Computer speakers, and pretty much anything else that uses trons.

Its getting really frustrating.

Heh....know what you mean! My last RFI "problem" is next door...they've got a set of cheap PC speakers...you know, the type most folks toss in the trash when they get their PeeCee and put "real" speakers onto them. I'm going to drop off a set of decent speakers as a gift....picked 'em up at Goodwill for $2 and tested them in the shack...no RFI interference.

If you can find them...the OLD RatShak dual line RFI filter worked great. This is the rectangular inline filter...not the newer one in most stores today. Seems the single line and the new dual line filters only go up to around 30m hz...the dual line units, for some reason, work great at 50mhz+. I found a bunch at a local RatShak and bought them all for 97 cents each. If your local RatShak has a clearance box..... I have stuck them on neighbor's phones....no more interference.

Major eliminators of RFI...getting the antenna higher, making sure the coax does not radiate, and make sure your signal is clean. I built the 100W amp I had mentioned the other week....much cleaner output than the Mirage I had before. Don't know if it was just that Mirage, but it tore up the neighborhood until I took it apart and cleaned up the connections inside, grounding everything and using star washers on any screws. The homebrew amp is inside a cast AL box. No RFI leakage problems here!! I use RG8X for the feedline...not optimal, but fewer XYL complaints. I just found our CC&Rs...says no external TV antennas, but does NOT prohibit AR antennas.....hmmmm. Would be nice to put the beam back up!

Cheers!
Andrew

Don't know about the rest here, but 99% of my 6M activity is on sideband, around 50.125 (calling freq.) and some CW (heh...SLOW....) on 50.100. There is only one 6M repeater I ever use, and oftimes it is to coordinate 220 or 432 activity. Not to say that there would be interest or not...but I'll be on the radio instead of the computer if I have the choice! I sit in front of two at work.....! Look at Yahoo groups....there may be a group already in existence. If not, try it and see what works out! Or post here, and see what response you get from the members on this list.
(Jamie, assuming that is OK??)

Cheers!
Andrew

Here where I live, there are several fire buffs that
are hams .. once in a while we chat, but not in a
regular net environment. Two of us, myself and
another ham run the unofficial website for the local
department. He is the webmaster (and the departments
civillian historian) , and I do behind the scenes
stuff.

Some fire buffs aren't firemen. Myself, I enjoy
seeing the trucks, and listening to calls on the
scanner. Lately, I have been taking pics of trucks
and doing historical research with my buddy who is the
local city departments civilian historian.

Of course, it does help that I am a hazmat technician.

Hello to the group, I hope to be radio active in the near future after a long time period away from ham radio. Have allways been interested in 6 and 2. at the present time I dont have a 6 meter rig but have a older hf and all mode 2 meter. with the openings few and far between do most of you just spot check or do you have a dedicated 6 meter rig on to monitor for openings? also I notice after reading the archieve that when someone ask about what type rig most of the replies is the 706 mkII, whick I think is a nice looking rig that has proven itself but I dont see any mention of the yaesu ft 857 or 897. also no in put on the IC 703+ aren't these rigs use much by group members?

Interesting question. It would make a good poll. I think a lot of new people tried Six when they got HF+6 or DC-daylight rigs like the 806. or 817. Others use Six-only rigs or some tri- or quad-banders that include Six. Then you can subdivide both groups by QRP/QRO.

My HF rig is a K2, so it made sense to get a Six-only rig (and the TenTec Six&Two wasn't out yet, or I might have been tempted). I got an MFJ-9406, then a Ranger 5054. I also have Mizuho and Tokyo Hypower HTs that do Six. That works for me - keeps me from just turning a knob to escape the Silence of Six!

It's interesting that you mention the FT-857. I should be receiving mine via UPS tomorrow. I am just getting into (or I should say just acquiring the equipment to get into) 6m ops. I already have a Cushcraft 3 element yagi for 6m. For a radio, I was considering the Ranger 5054DX, 100 watt version, but at $400, it was a bit pricey for a limited single-band rig with no CTCSS (6m repeaters). With the current rebate, the 857 is costing me just under $600. The features (CTCSS, alpha channel tags, tons of memory channels) are much better than the 5054DX100. I will be using the 857 primarily as a base unit, on 6m, 2m, and 70cm. When I am able to, I plan on using the HF bands, too. Looking forward to hearing some of you on 6 meters.

Darn...mine isn't arriving until Monday! Let me know how you like it....I
did a ton of research on it, hope it is a decent rig. This is my first <<new>>
rig...all others have been used, DOA's rebuilt by me or homebrews. WooWoo!
I get to take a rig out of the original box!!!

More seriously, I researched the Kenwood rigs (excellent, pricey, but good
reputation), discounted the TS2000 (too big for me as a mobile); the Icom 706
(706 MkIIG is an excellent rig....played with one for awhile, was looking at it,
when the Yaesu rebate came up) & the 703+ (finals problem....two local guys
who have them BOTH lost finals); the TenTec 6n2 (excellent SSB/CW rig..TT does
that better than anyone except maybe Elcraft, but only fair FM) and the Yaesu
rigs. The FT100D is rather well debugged, the 817 is VERY interesting, but
when the 857 came out, I opted for that unit. Why? One, the rig has been
fairly well debugged (FT100/100D was the "testing ground" and most of the problems
were avoided on the 857); two, the unit fits the space I have available in the
company vehicle, but still gives me 100W out when needed, and QRP when
wanted. Three, the head is easily removeable and remote mountable. Fourth....$$.
At $600 landed after rebate, the $$/performance matrix pointed at the 857.
Last? I can direct connect the ATAS120 to it (when I get that OTHER rich uncle
to leave me in his will....hehe) as I can't mount a full sized screwdriver on
the vehicle. DC to daylight....I'm an engineer by trade, and MY head spins
when I consider what is stuffed inside that tiny box!! Antennas will be the
Comet UHV-6 and the SB15 for 2/70cm.

Just hope it works well....! Check out the FT857 Yahoo group, also.

Cheers!
Andrew

At $600, it's moved from "that's nice" to "intriguing".

> I'm an engineer by trade, and MY head spins
> when I consider what is stuffed inside that tiny box!!

My only problem with the 857 (and most of the other "small" rigs) is that the ergonomics just aren't there as far as I'm concerned. I'm willing to pay a size penalty in order to get switches and knobs that are big enough and far enough apart and plentiful enough that I don't have to page thru menus on the little display and accidentally hit the wrong button; I have enough issues like that with my FT100 at *home*, and it's REALLY hard to operate in the car.

> Antennas will be the

I'm hoping that there's a long skinny Comet package under my tree this Christmas :-). How do you like the SB15? The eham reviews were quite positive.

hey bruce
i dont know if you have ever owned any of these new radios but even the BIG radios all use the menus system and multifunction buttons
but the good news is 99% of the features i find i dont use all that often so once its setup the way you like it its not a problem
i own a Icom 706MkIIG and a 756Pro and dont really have a problem with either one and i am legally blind so if i can handle it you guys should be able to as well

I have a Yaesu FT-100. For the "all the time" things - volume, squelch, tuning in a band - it's not bad at all. It's when I start switching DSP features on and off, changing bands, selecting memory presets, etc., that it becomes awkward to operate when it's used mobile. It'd help some if I could snag a separation kit for it, and mount the panel up where it was easy to get to.

I've played with the IC-706MkIIG (UF's club has one - it's the main 6/2/70 rig) but I guess I'm too indoctrinated to Yaesu's controls; I get frustrated 'cause the Icom's user interface is different :-).

Yup! Hit the right price point, and the German side (ach! Das ich ein gut Radio!) and the Scots side (Och? Are ya crazy, man! Ye be spendin' MONEY fer that thin!!) finally agreed on something.

> I'm an engineer by trade, and MY head spins

True....and it is one point to ponder. My DX70TH head is mounted on a pedestal which sits in one of the cup holders in the vehicle. The DX-70 is great for mobile...easy to operate, no funky menus, no cheat cards, etc. A local ham who purchased an early 857 said that mastering the basic functions takes awhile, but he can now run thru the normal menu items by touch. Main advantage to me is the "one box" theory....i.e., the XYL will complain less about the one rig as compared to the three currently installed. As the 857 head will be mounted at fingertip height (pedestal is an old cellphone cradle holder, sets the head right at my hand when my arm is on the armrest), I hope that it will be fairly easy to navigate the vehicle and the radio without driving into trees, ditches, other cars, etc.... To get a good NB and DPS, I hope it is worth it! If not, I'll use the DX-70 mobile and put the 857 in the house.

<I'm hoping that there's a long skinny Comet package under my tree this
<Christmas :-). How do you like the SB15? The eham reviews were quite
<positive. >>

I like it quite a bit. It replaced the old Larsen dualbander....and, as I do some sideband mobile on 2M, it increased my "check-in-ability" to the local SSB net considerably. According to the MFJ259B, bandwidth is considerably wider. Gain is better than the larsen (of course, the SB15 is much taller) tho I still don't believe their numbers. A/B testing with the Larsen showed the SB15 to be 2-3 S-units higher on sideband. Test rig was a Kenwood TR751A. I'll drive the SB15 with the 2/70cm side, and use the UHV6 for 6M & HF. Quality? The new SB15 is MUCH better than the first version...mine has around 90,000 miles on it...no problems in 3 yrs. I have the UHF mount version.

I'll post updates after I get the rig set up and test it a bit (and the giddyness wears off....!)

Cheers!
Andrew

I'm considering getting an FT-857 to replace my 8100R, Alinco DX-70 and Alinco M06 in the car. It's at such a great price, it's hard to resist.

I'm not so impressed with the DX-70. I've run it in the mobile for some time, but it's noise blanker sucks! It's OK for FM use, but I use the DRM06 for most of my FM work, as the PL on the DX-70 is way to hard to change, especially when mounted remotely.

I didn't realize how bad the NB was on the DX-70, until I brought it in the house for the winter. I also have a Yaesu FT-726R for 6M use, and during the last E skip, I compared the 2 rigs. The DX-70 was only useable on the stronger contacts, and even stations I could clearly hear on the 726R at S5 were completely unreadable on the DX-70. Most of this was because of the noise blanker on the 726R.

In our repeater group, a bunch of guys have bought the FT-857, and love it.

Yup...the one of two flaws in an otherwise good rig. I did the mod (www.mods.dk) and it helped it. It would be nice if Alinco had designed a better NB...heck, even chicken band rigs have NB's which work! I worked on the vehicle (fuel pump, esp.) and got the background noise down to S2-3.

I do very little FM on 6....the PL is set for the only repeater I use. Again, a flaw in the basic design. As for the 726, good rig. I've got the 736R at home...both qualify as one of Yaesu's better radios, for certain. Glad to hear the comments about the 857....it does sound like a winner!

Andrew

It has been posted on this reflector that the 857's receive section is poor
and not as good as the FT100/D.
Any more comments from current users?

Hmmmm...according to the ARRL test and the comments on the Yahoo group,
receive is said to be superior to the 706MkIIG (which was, in general, on par with
the FT100D) and better on VHF/UHF (ala the 100D). Some variation of the
sample tested was noted against the 897 (which is weird, as the receive section is
the same...production variances??) and that it was on par with the 100D, which
has a hot receiver. I doubt that any of them will be dogs, tho! Heh...if
anyone wants to donate an FT100D and a 706MkIIG, I'd be happy to do a long term
eval on all three!!

For testing on 2M, I'll put it up against the Kenwood TR751 when I get it.
That is the "hottest" 2M receiver I own. Don'tthink the 857 will be as good
as the 736R (w/modded front end) on 2 or 440.....we'll see on 6M.

BTW, on the DX-70.....as a receiver, my unit was just about as good as the
736R....which says alot. If a sig was REALLY down in the junk, the 736R would
do better, but the -70 did well nontheless.

Last item...if anyone comes across a dead (but not torn up) ATAS100, let me
know, please. I'm interested in trying something with the guts of the ATAS100.
Hehe... "science project!!"

Tnx!
Andrew

I'm suprised that no one mentioned the Alinco dx-70th, Works Great on 6 with 100 watts, That is my main 6m rig, I also have a ft-680 10 watt rig that needs a little work, but may soon become a beacon. I also have other HF only Rigs(TS-530SP, and TS-820) so I can moniter 50mhz on the Alinco and still work a little HF. I just put up a new antenna, Its a home brew beam 5 elements on a 16 foot boom at 55 feet, got a chance to try it out last Sat evening,during a small opening, Seemed to work pretty well. Don't discount the DX70TH for a 6M rig, its simple, 100 watts out, and costs less than the 706mkIIg!!

I run a FT-817 on 6m but right now that rig gets used in the car mostly on 17m (HF Pack Group). Since its not a permant installation in the car its kept in a bag which is brought in everyday. Right now since 6m is not open alot I depend on email groups to allert me to opening. When we are having lots of 6m openings the FT-817 is on constantly. Then I hook it up to my 80m inverted vee and go for it. Too lazy to put the 3 el beam back up. hi Main rig is K2, and I do have a Ten-Tec 6m transverter to build if I ever get around to it. hi

Interesting question. It would make a good poll. I think a lot of new people tried Six when they got HF+6 or DC-daylight rigs like the 806. or 817. Others use Six-only rigs or some tri- or quad-banders that include Six. Then you can subdivide both groups by QRP/QRO.

My HF rig is a K2, so it made sense to get a Six-only rig (and the TenTec Six&Two wasn't out yet, or I might have been tempted). I got an MFJ-9406, then a Ranger 5054. I also have Mizuho and Tokyo Hypower HTs that do Six. That works for me - keeps me from just turning a knob to escape the Silence of Six!

Hello to the group, I hope to be radio active in the near future after
a long time period away from ham radio. Have allways been interested
in 6 and 2. at the present time I dont have a 6 meter rig but have a
older hf and all mode 2 meter. with the openings few and far between
do most of you just spot check or do you have a dedicated 6 meter rig
on to monitor for openings? also I notice after reading the archieve
that when someone ask about what type rig most of the replies is the
706 mkII, whick I think is a nice looking rig that has proven itself
but I dont see any mention of the yaesu ft 857 or 897. also no in put
on the IC 703+ aren't these rigs use much by group members?

thats right about 35 miles south west down I-35. I also have a rig for 10 meter and one for 2 meter all mode, also an older hf rig, just finished building a 135 foot dipole but the sun set before I could climb the tree (hi hi). nothing for 6 meter at this point and dont have an antenna up for 2 yet, have a old 13 element beam and a pair of loops but not set up. have plenty of outside space but not a lot of inside space at this time for a station. I also am looking at the 857 pretty hard, I really like the 817 but it seems like you need more than 5 watts to be effective on 6 and 2 as a general rule. right now I would be happy to be able to get out a couple hundred miles on a routine basis on those bands. guess i like them because antenna's are simpler and more economical.

Cool, The screwdriver works pretty well on 6M. I had it ground mounted (by far not the best) about 2 ft off the ground with other mansonry townhouses surrounding me about 50ft away. Worked TX, FL and AL from here with 100w on 6M. A visiting friend also worked several countries in Europe with 100w.

I'll ship it tomorrow UPS. Keep an eye out for a 6" diameter white tube about 6ft long.

Topic: 4307 Message: 4307

Since I am new to 6 meters I was trying to find some kind of temp. antenna to get on the air in case the band opened up. I have a mini antenna from iron horse for 6 meter but the swr sky high on that thing. Can't figure out what was wrong. Tried a 5/8 two meter antenna but I was thinking the rod would have to be longer but with the small amount of adjusting I have it looks like it would have to be cut to make the rod shorter. Since this is temp. I hate to mess up my two meter antenna. For the lack of anything else to do I had a cheap R/S 11 meter mag antenna in my shack. I tried it with the rod in it and got a high SWR like I expected. My rough calculations I rigured the rod would have to be 1/2 the lenth it was. I pulled the rod out and was going to do some expermenting then I decided I would see what would happen with the 4 inch stub above the coil. To my surprise I got a SWR 1:1.5 accross the entire band. I would love to try it on the air but with no band opening kind of hard to do. Before I go through the trouble of mounting this thing what do you guys think. Do I have a workable antenna or like I suspect a dummy load. Thanks for your feedback.

Dear Terry....remember that SWR is only part of the picture. As you rightly suspect, that antenna will not do too terribly well. After all, a dummy load also has a low SWR.

Try the following....a Jpole (google for jpole, you will get lots of hits) or, if you want something this evening, try a dipole. Cut two pieces of wire 54" long and center connect them to coax (i.e., one piece to the shield, one to the center conductor). You'll need a "choke" to keep RF off the coax, so make a small (6" dia) roll of about 5 turns of coax just down from the antenna. You will want the antenna horizontally polarized, of course.

I have a "travelling dipole" which is nothing more than two RatShak 72" whips mounted in a chunk of nyloc (plastic) drilled out for a vertical mount. To tune the antenna, I have a piece of 54" string tied to the center piece. Quick measurement to set the whips at 54" and I'm ready to go.

Hope to hear you on the air!

Hi Mike, Thanks for the contact, It was a short opening for me, only got 6 stations, worked stations in en-84,fn-65,fn-54,fn-46,fn-15.all Aurrora, 2on cw and the rest on ssb, never really opened up for me here in fn-65, but did manage to bag several new grids, including fn-46!! (Send me a card in the BURO)Hope to get another good opening before the end of the year, I just started 6M this year, so far 92 grids, and I want 100 before the end of the year!! I could hear a VA2MGL/B till quite late on AU, but no stations, Its frustrating sometimes. I was hoping for ox3 contacts last night, but they are pretty rare, I've heard the OX3/B many times but only made one contact OX3SA back in June. Good Luck to All, And HAPPY HOLIDAYS!!! Terry,
Normally a 5/8 2mtr antenna doesnt need any trimming to work on 6mtrs as a base loaded quarter wave antenna. Make SURE it has enough ground plane under it or else it will not radiate properly.
The CB antenna is probably not working as an antenna but a dummy load as you suspect...a normal 1/4wave antenna at 27Mhz (108inches) will be a 1/2wave antenna at 54 MHz and the feedpoint Z will be very high (around 1000ohms or more). A shortened antenna will have an even worse match!
If the antenna has a midpoint loading coil in it, this will also be a problem trying to use it on 6 even if you cut the whip above it..

Use the 2m antenna instead and leave the whip, etc as is....just put a decent ground plane under it and it should work just fine...
(Thats what I run mobile on 6 FM)

I've just built a 6 meter j-pole of 3/4" copper pipe that uses a
102" stainless whip to reduce weight and wind loading on the top
end of the antenna. I've got it jury rigged on guyed steel conduit behind
the house at about 19 feet and it worked pretty well during some recent band
openings. Don't thank I've got more than $30 in it. The website describing
it is:

http://tcarc.ca/6mjpole.html

If I didn't screw it up, that'll get it .

The quickest antenna would have to be a simple dipole. Yeah, a choke is sometimes needed, but cut a dipole, solder the coax to it, and see what happens.

I worked the Bahamas on my dipole, indoors under a tin roof, within fifteen minutes of beginning construction. (Not to say it was a miracle antenna, but just to say it was quick and will radiate.)

I am using a vertical whip with spring (Motorola) mounted on my left rear cowl it is 57 inches from the car mount to the antenna tip. The reason for the extra length is due to the car metal being above its base by 6 or 8 inches but It works fine with 6o watts fwd and l;ess the 1 watt returned with a model 43 watt meter using a 100 watt element for forward and a 10 watt for reverse measurement Joe

Terry, Keep listening, It will open soon,we hope, I've worked about 30 stations on es and 6 on Aurrora in the past week so it is starting to open a little, If you have access keep an eye on the DX cluster,I connect via telnet at work and keep it in the background watching for any action, If its opening there will be spots.
Good Luck and Merry Christmas to All

To paraphrase Emeril, " I don't know where you get your time, but mine comes in GMT"

Seriously, an email reflector is not a very good means of keeping up with fast changing band conditions. Take a look at
http://dxworld.com/50prop.html
and
http://chat.dxers.info/?b=6m
for real time postings.

Have fun,
John

Well, I'll say this much: it was the biggest six meter opening I've seen in my short time on 6. Things started happening around 4PM EST and didn't taper off until about 8. I only worked one station (an FM18 from EL95) - likely due to my inexperience, low power (10 watts) , and an omnidirectional antenna. But, I heard stations all over - from Texas, Maine, NY, NJ, MD, VA, etc.

Poor poor pitiful me. Yesterday all I heard was a lot of backscatter with you guys having all the fun. OH WELL, wouldn't have mattered much. I have all sorts of power line interference (S9 plus) to the east unless it's raining. Our man Riley (Hollingsworth) has suggested I turn the matter over to the ARRL and if they can't get it fixed then he will tackle it. But I have faith, Santa delivered a sleigh full of M2 antennas (6m and 2m).

BTW, Dennis makes a good suggestion re: the amp but don't forget more and better antennas higher in the air. I liked the omni but yagi's win hands down.

Was that a horizontal omni or a vertical omni ?

My first contact was with a ringo from Texas to Colorado on about 8 watts.
Conditions were just right although the other station was running a horizontal beam.

Since I built a 3 element beam and wired up a cheap small rotater I hear a lot more.
I need to set up a inverted V for 6 since the ringo doesn't hear much....wrong
polarization.

doug
i agree 100% on the antenna but you know how some of these people are
they get themselves in areas where they cant have good antennas
i myself worked many stations and with my 6 ele yagi at 40 foot was
getting S9 reports most of the time
so in the releam of 6 meters its Antenna then feedline(not the RS RG8)
then finally radio ranked according to importance IMHO

An inverted V radiates vertical just like a Ringo. Leave it as a DIPOLE if you want H pol...when the band opens, polarization doesnt count that much...but when the band is NOT open, the same polarization helps every little bit! :)

Topic: 4349 Message: 4349

Last night was my first "big" opening.
I worked a number of stations in Florida, Georgia, Alabama, Arizona, Nevada, Utah, and Colorado as well as here in Texas.
What amazed me was a lot of the stations I worked in Florida happened while I had my meager beam pointed west and I worked them off of the back with <10 watts and still got 57, 58, and 59 reports.

I only fired up the amp on 3 of the contacts...everything else was barefoot.

Lots of fun !!!

73,
Jon

Jamie, Glad to work You last Night, Hope You made lots of contacts, opening was short for us in the north, really only open for 30
minutes or so,But made 24 contacts and picked up 2 new grids, Lucky is the 6 M OP who gets a good band opening early on, after
one good opening you are hooked, at least I was, I work most of the HF bands, But by far 6 is the Best

From: Brian McClure
Topic: 4353 Message: 4353

I'm unfortunate enough to live in a townhouse and have neighbors :-)

Aside for antenna restrictions, I've been fighting a battle with TVI/RIF for several months on 6 and HF. After a total rebuild of the ham radio setup, I'm finally getting some of it ironed out.

I'm operating the radio in a VERY temporary configuration, with the wire antenna stretched across the front yard about 5ft off the ground, to try and eliminate as many parts of the puzzle as possible.
So far I've relocated the coax, radio and tuner, replaced the coax with a better grade of cable, moved the antenna, and installed a better grounding system. The previous antenna was a random length wire stretched out on the roof.

Radio is a Alinco DX70TH with an Icom AH-4 Tuner/Coupler at the antenna feed point.
Antenna is a 26ft long piece of 14ga copper wire.

I'm no longer getting RFI into every electronic device when transmitting 6-80meters
I was getting in to speakers, stereos, TV's, etc

Currently HF is no longer a problem even at 100w.
6 meters from around 51mhz and down is now my problem area.

Transmiting on 50.125 and I cause interference in the TV audio, very bad with TV on channel 3.
Change TV to ch2 or ch4 interference is reduced (on my TV)
Neighbors have it on a wider range of TV channels.

Change my TX freq to 51.125 and no TVI at all on any TV channel even with 100w transmit power out.

I'm on DirecTV for my house, but have a cable modem. I've grounded my tv cable sheild at the point where it enters the house.
I can hear it on my TV even with it connected to the satellite box.

I'm going to ground the neighbors cable at the feed box outside the house, to see if this helps.

Neighbors also use the digital telephone over the TV cable. I'm guessing this might be allowing the phone wiring to act as one BIG antenna and then feeding it into the tv cable at the junction box.

Here are my next steps.
A friend is giving me a low-pass filter that has proven to help on 6m.
And I'm looking to possibly add filters to the input of the neighbors TV's

Any other ideas, comments, complaints?

Thanks & 73
Brian

Hi Tom,

Get used to it. That's what we get for living in 5 land.

i see by looking at the maps 6 meters is open all over the country
except here in texas! i made a whole 2 contacts since 2 pm, one to
do62
in canada. ho hum...
